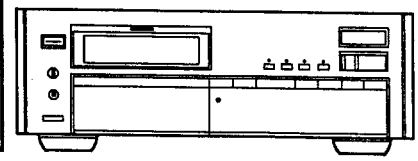
Service Manual



ORDER NO.
RRV1172

The chapter 1 of this Service Manual will not be reprinted. On your additional orders, we may supply only the chapter 2. For the chapter 1, please make copies and attach to the chapter 2 at your side if necessary.

COMPACT DISC RECORDER

PDR-09

THIS MANUAL IS APPLICABLE TO THE FOLLOWING MODEL(S) AND TYPE(S).

Type	Model	Power Requirement	Remarks
	PDR-09		
KU	○	AC 120V	

CONTENTS

CHAPTER 1

1. SAFETY INFORMATION

This service manual is intended for qualified service technicians; it is not meant for the casual do-it-yourselfer. Qualified technicians have the necessary test equipment and tools, and have been trained to properly and safely repair complex products such as those covered by this manual.
Improperly performed repairs can adversely affect the safety and reliability of the product and may void the warranty. If you are not qualified to perform the repair of this product properly and safely, you should not risk trying to do so and refer the repair to a qualified service technician.

WARNING

Lead in solder used in this product is listed by the California Health and Welfare agency as a known reproductive toxicant which may cause birth defects or other reproductive harm (California Health & Safety Code, Section 25249.5).
When servicing or handling circuit boards and other components which contain lead in solder, avoid unprotected skin contact with the solder. Also, when soldering do not inhale any smoke or fumes produced.

NOTICE
(FOR CANADIAN MODEL ONLY)
Fuse symbols (fast operating fuse) and/or (slow operating fuse) on PCB indicate that replacement parts must be of identical designation.

REMARQUE
(POUR MODÈLE CANADIEN SEULEMENT)
Les symboles de fusible (fusible de type rapide) et/ou (fusible de type lent) sur CCI indiquent que les pièces de remplacement doivent avoir la même désignation.

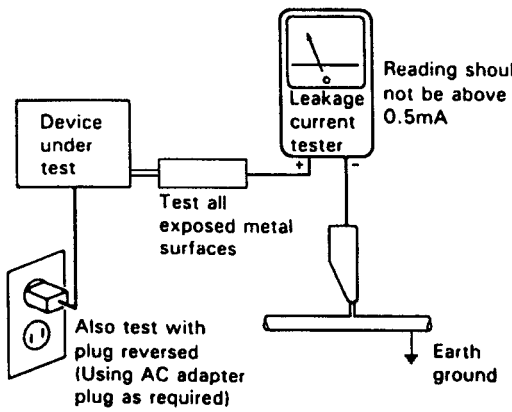
(FOR USA MODEL ONLY)

1. SAFETY PRECAUTIONS

The following check should be performed for the continued protection of the customer and service technician.

LEAKAGE CURRENT CHECK

Measure leakage current to a known earth ground (water pipe, conduit, etc.) by connecting a leakage current tester such as Simpson Model 229-2 or equivalent between the earth ground and all exposed metal parts of the appliance (input/output terminals, screwheads, metal overlays, control shaft, etc.). Plug the AC line cord of the appliance directly into a 120V AC 60Hz outlet and turn the AC power switch on. Any current measured must not exceed 0.5mA.



AC Leakage Test

ANY MEASUREMENTS NOT WITHIN THE LIMITS OUTLINED ABOVE ARE INDICATIVE OF A POTENTIAL SHOCK HAZARD AND MUST BE CORRECTED BEFORE RETURNING THE APPLIANCE TO THE CUSTOMER.

2. PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in the appliance have special safety related characteristics. These are often not evident from visual inspection nor the protection afforded by them necessarily can be obtained by using replacement components rated for voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual.

Electrical components having such features are identified by marking with a ⚠ on the schematics and on the parts list in this Service Manual.
The use of a substitute replacement component which dose not have the same safety characteristics as the PIONEER recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, or other hazards.

Product Safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current PIONEER Service Manual. A subscription to, or additional copies of, PIONEER Service Manual may be obtained at a nominal charge from PIONEER.

1. SPECIFICATIONS

1. GENERAL

Model ..... Compact disc audio system
Applicable discs ..... CDs and CD-Rs
Power supply ..... AC 120 V, 60 Hz
Power consumption ..... 35 W
Operating temperature ..... +5°C to +35°C
Weight (without package) ..... 14.2 kg
Max. dimensions ..... 440 (W) x 445 (D) x 160 (H) mm
17-11/32 x 17-17/32(D) x 6-5/16(H) in

2. AUDIO UNIT

Frequency characteristics ..... 2 Hz to 20 kHz
Playback S/N ..... 112 dB (EIAJ)
Playback dynamic range ..... 97 dB (EIAJ)
Playback total harmonic distortion ..... 0.0026 % (EIAJ)
Playback channel separation ..... 100 dB
Recording S/N ..... 92 dB
Recording dynamic range ..... 92 dB
Recording total harmonic distortion ..... 0.004 %
Output voltage ..... 2 V
Wow-flutter ..... Less than measurement limit
(±0.001% W.PEAK) (EIAJ)
Number of channels ..... 2 channels (stereo)
Digital output ..... Coaxial output: 0.5 Vp-p ±20% (75 Ω)
Optical output: -15 to -20 dBm (wavelength: 660 nm)
Frequency deflection: Level 2 (standard mode)

3. INPUT JACKS

Optical Input jacks (3 system)
Coaxial digital input jack
Audio LINE input jack

4. OUTPUT JACKS

Optical digital output jack (2 system)
Coaxial digital output jack
Audio LINE output jack

5. RECORDING FUNCTIONS

- Recording
- REC MUTE
- AUTO SPACE MUTE:
- AUTO TRACK INCREMENT
- AUTO REC/PAUSE
- Remaining recording time display
- Peak Margin display
- PREVIOUS
- MANUAL TRACK INCREMENT
- MANUAL INDEX INCREMENT:
- INPUT SELECTOR
- TOC Write
- Recording cancellation

6. PLAYBACK FUNCTIONS

- PLAY
- PAUSE
- STOP
- MANUAL search
- TRACK search
- INDEX search
- Direct song selection
- 1 Track repeat
- All track repeat
- Programmed repeat
- Programmed playback (max. 24 tracks)
- Program check
- Program correction
- Program clear
- Pause programming
- Reserved program
- SKIP playback
- DISPLAY OFF
- TIME display switching

7. ACCESSORIES

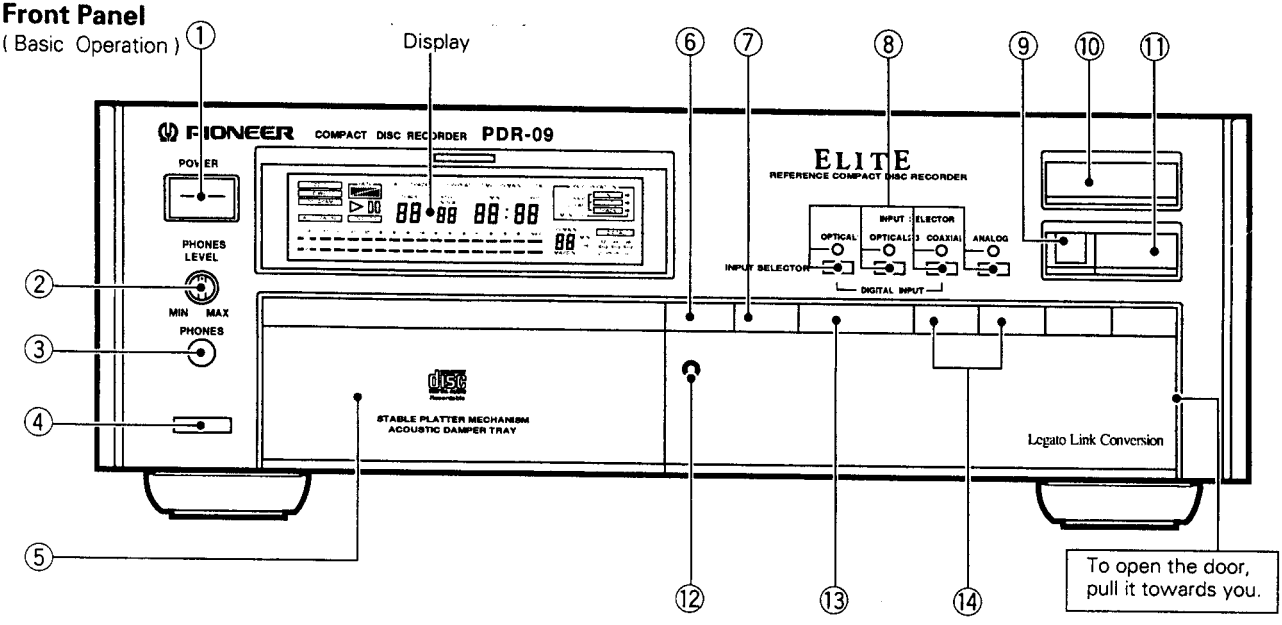
- Remote control unit (CU-PDO57) 1
- Size AAA/R03 dry cell batteries 2
- Audio cable 2
- Control cable 1
- Turntable sheet 1
- Operating Instructions 1

NOTE:

The specifications and design of this product are subject to change without notice, due to improvements.

2. PANEL FACILITIES

Front Panel
(Basic Operation)



Buttons for basic operation

① POWER switch

Pressing this button switches the power ON. Pressing it again switches the power OFF.

NOTE:

Be sure to remove the CD - R disc before switching the power OFF. Otherwise important data such as TOC and SKIP information may be deleted.

② PHONES LEVEL adjustment knob

③ PHONES jack

④ Remote control receiver

⑤ Disc tray

To load a CD or CD - R.

⑥ OPEN/CLOSE (▲) button

To insert/remove a CD or CD-R. The disc tray ejects/retracts each time this button is pressed.

⑦ STOP (■) button

Press to stop recording or playback. Pressing this button terminates all operations of the system (Stop). If this button is pressed while the system is stopped and when a program has been input, the program will be cleared (Clear).

⑧ INPUT SELECTOR button and indicator

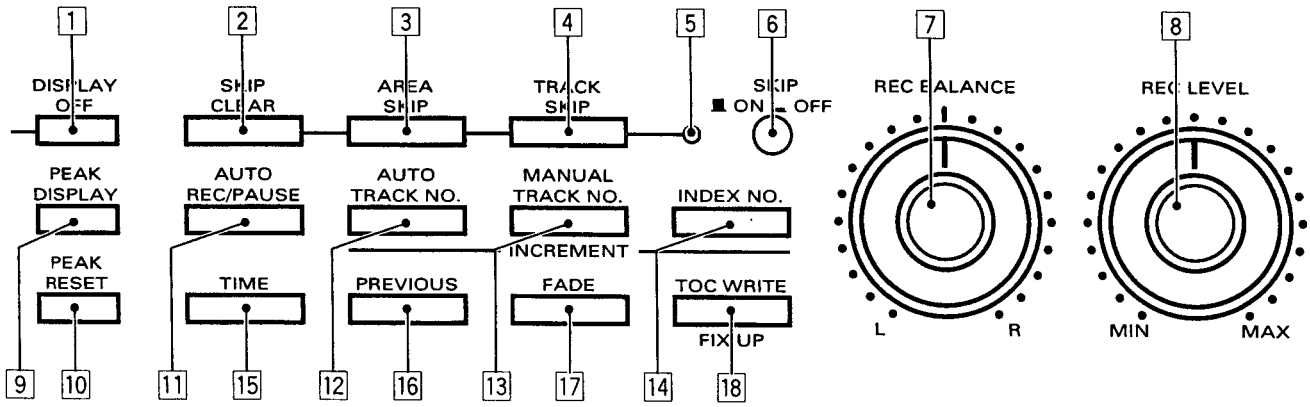
To select an input source to be recorded. The input source must be selected for both digital and analog inputs. The indicator lights up when the button is pressed.

OPTICAL 1: To record from an equipment connected to the digital OPTICAL 1 input jack.

OPTICAL 2/3: To record from an equipment connected to the digital OPTICAL 2 or 3 input jack. (Changeover between OPTICAL 2 and 3 is performed by means of the switch on the rear panel. Refer to Page 12.)

COAXIAL: To record from an equipment connected to the digital COAXIAL input jack.

ANALOG: To record from an equipment connected to the (analog) LINE IN jack.



⑨ REC (●) button
Press to switch the system to REC/PAUSE mode. The REC and PAUSE indicators light up. To start recording, press the PLAY (►) or PAUSE(II) button.

⑩ PAUSE (II) button
Press to pause the system during recording or playback. To resume operation, press the button again.

⑪ REC MUTE (O) button
Press during recording to create a 4 - second blank and pause the system.
Holding down this button creates a break as long as it is pressed. Releasing the button pauses the system.

⑫ DISPLAY OFF indicator
Lights up when all indicators are off.

⑬ PLAY (►) button
Press to play back a disc or start recording.

⑭ TRACK search button
Press to search a desired title during playback (or programmed playback) or pause. Pressing this button forwards to the next song or reverses to the previous song.

⑮ MANUAL search button
Press to fast forward or reverse during playback or pause. The system continues fast forward/reverse as long as the button is held down.

[1] DISPLAY OFF button
Press to turn the display off (see "To turn the display off" on page 30). To prevent influence on the sound quality, the system deactivates all circuits not in use while the display is turned off.

[2] SKIP CLEAR button
Press to delete SKIP information.

[3] AREA SKIP button
Press to specify areas to be skipped during playback.

[4] TRACK SKIP button
Press to specify tracks to be skipped during playback.

[5] SKIP ON/OFF indicator
Light up to indicate that SKIP information can be input/cleared (SKIP OFF).

[6] SKIP button
ON :Press out to enable SKIP playback.
OFF :Press in to disable SKIP playback so that SKIP information can be input.

[7] REC BALANCE adjustment knob
Turn to adjust the balance (L and R) of the input level when recording analog signals.

[8] REC LEVEL adjustment knob
Turn to adjust the recording level in accordance with the input source when recording analog signals.

[9] PEAK DISPLAY button
Press to switch between Peak Margin display and Remaining Recording Time display.
- The Peak Margin display shows the margin of the input level to the maximum allowable input in "dB".
- The Remaining Recording Time display shows the time recordable for the CD-R.
  During TOC recording, the display shows the time required for completion of TOC recording in minutes.

[10] PEAK RESET button
Press to reset the Peak Margin. When the button is held down, the system shows the margin in real time.

[11] AUTO REC/PAUSE button
Press to automatically start/stop recording when copying a CD, CD - R or MD to a CD - R disc by using digital signals. During digital recording from other sources, the system automatically stops recording 30 seconds after a blank (no signal) is detected.
When recording analog signals, the system automatically stops recording 60 seconds after the source equipment stops playback.

[12] AUTO TRACK NO. INCREMENT button
Press to automatically update recording track numbers in sequence when recording to CD - R discs.

CAUTION:
This function differs during digital and analog recordings. It also differs, depending on the source equipment.

[13] MANUAL TRACK NO. INCREMENT button
Press to manually update recording track numbers when recording to CD - R discs.

[14] INDEX NO. INCREMENT button
Press to manually update recording index numbers when recording to CD - R discs.

[15] TIME button
The time display changes in the sequence of TIME, REMAIN and TOTAL each time the button is pressed.

[16] PREVIOUS button
Press to confirm the final recording condition and the recording end point (for example, when additional recording is required).

[17] FADE button
Press to fade in or fade out during recording or playback. Also, use this button to set the fade time.

[18] TOC WRITE button
Press to write TOC information to CD - R discs. Once TOC information is written, the CD - R discs can be played back with normal CD players.

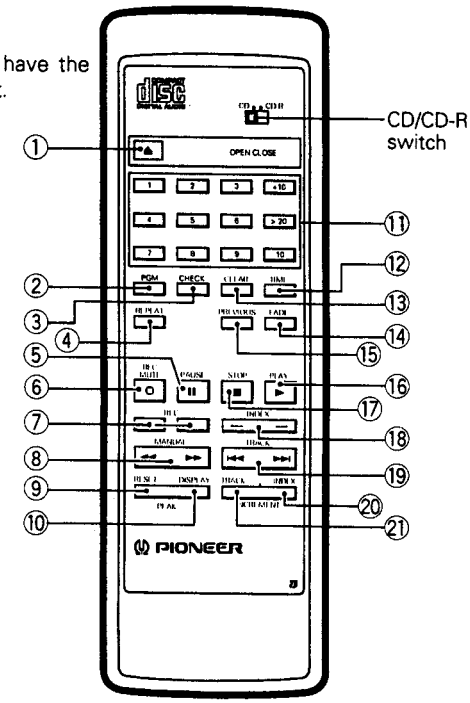
IMPORTANT !

After TOC information is written to CD - R discs, they cannot be used for further recording.

• REMOTE CONTROL UNIT

Remote control unit

* The button of the remote control unit have the same functions as those on the main unit.



① OPEN/CLOSE button (▲)

② PGM (program) button
For programmed song selection.

③ Check button
To check a program.

④ REPEAT button
For repeated playback.

⑤ PAUSE (II) button

⑥ REC MUTE (O) button

⑦ REC (●) buttons
Pressing the two buttons simultaneously switches the system to REC/PAUSE mode.

⑧ MANUAL search button

⑨ PEAK RESET button

⑩ PEAK DISPLAY button

⑪ Digit buttons (1 to 10, + 10 and > 20)
To specify title numbers for direct or programmed song selection.

⑫ TIME button

⑬ CLEAR button
To delete a program.

⑭ FADE button
To fade in or fade out during recording or playback.

⑮ PREVIOUS button

⑯ PLAY (►) button

⑰ STOP (■) button

⑱ INDEX search button
To search a break between musical portions or between songs (index) during playback or pause.

⑲ TRACK search button

⑳ INDEX NO. INCREMENT button

㉑ MANUAL TRACK NO. INCREMENT button

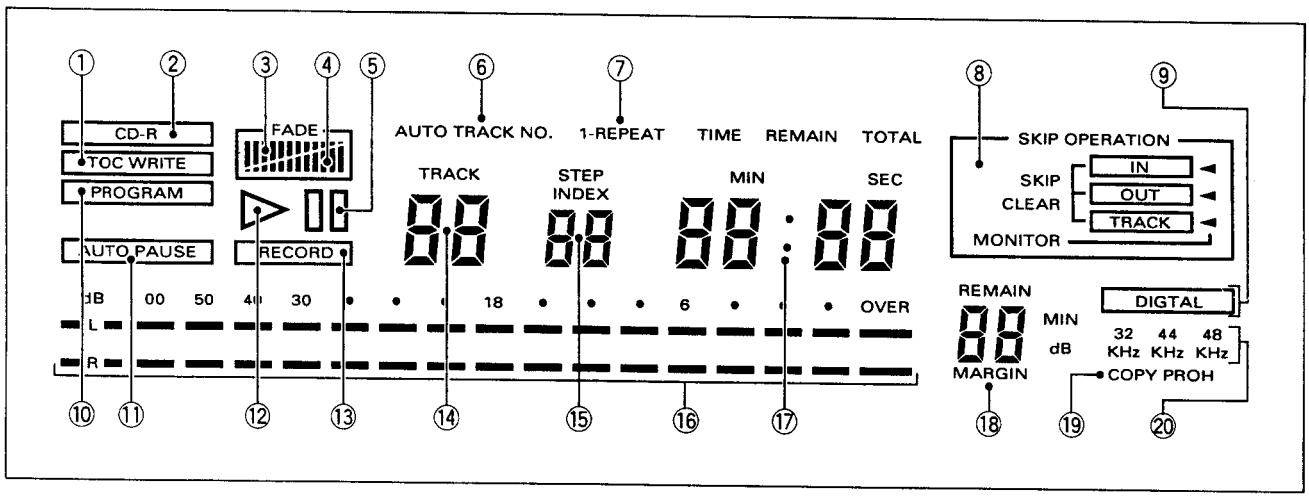
CD/CD-R switch

CD : The remote control unit can be operated with other Pioneer CD players having the SR symbol.

CD-R : Select this setting for using the remote control unit only for this unit.

• Be sure to set the CD/CD-R switch on the rear panel of this unit (see page 9) to the same setting as with CD/CD-R switch of the remote control unit.

• DISPLAY



①Lights up when writing TOC information to CD - R discs. Blinks when TOC information is required to be written.
②Blinks while the system identifies the disc. Lights up when CD - R discs are used.
③Blinks during fade - out and during input of the fade - out time.
④Blinks during fade - in and during input of the fade - in time.
⑤Lights up during pause.
⑥Lights up when the system enters Auto Track Number mode.
⑦Lights up when the system enters repeat playback mode.
⑧Lights up, turns off and blinks when SKIP information is input/cleared.
⑨Lights up if digital input is locked during recording mode.
⑩Lights up when the system enters program mode.
⑪Lights up when the system enters AUTO REC/PAUSE mode.
⑫Lights up during playback.
⑬Lights up during recording. Blinks when the system enters Recording Mute or Recording Monitor mode.
⑭Displays the track number.
⑮Displays the index or program steps.
⑯Displays the peak value of the input level during recording. Displays the peak value of the playback level during playback. (See page 21.)
⑰Displays the elapsed playback time, remaining playback time, total playback time, elapsed recording time, remaining recording time, total recording time, relationship between the start and end points for area SKIP input, points for area SKIP input, and remaining time until end of TOC data recording.
⑱Displays the remaining recording time and the peak margin during recording. Displays the total remaining playback time during playback, and the total programmed playback time during programmed playback. Displays the remaining time for completing TOC writing.
⑲Lights up or blinks when the system detects the digital signal to disable recording, as specified by SCMS.
⑳Displays the current sampling frequency (Fs) of the digital input. All three indicators turn off if the input signal is interrupted during digital recording.

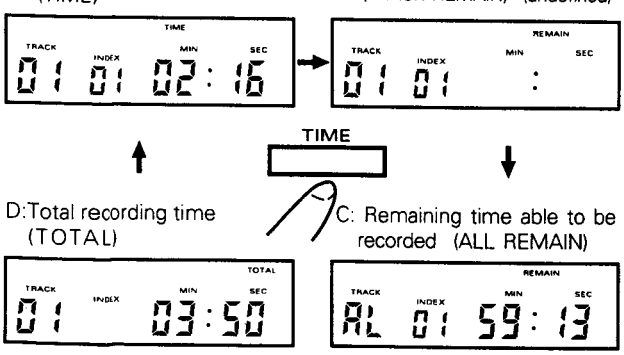
Switching the time display

The time display can be switched to check the recording time during recording, and the playback time during playback.
The display changes in the sequence of A, B, C and D each time the TIME button is pressed.
Note that the time during recording is displayed in a different way from the time during playback

Recording

A: Elapsed recording time (TIME)

B: Remaining time of the song being recorded (TRACK REMAIN) (undefined)



TIME

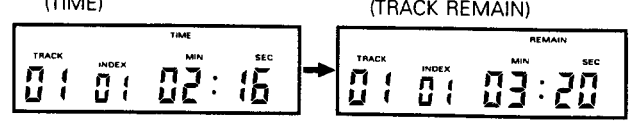
D:Total recording time (TOTAL)

C: Remaining time able to be recorded (ALL REMAIN)

Playback

A: Elapsed playback time (TIME)

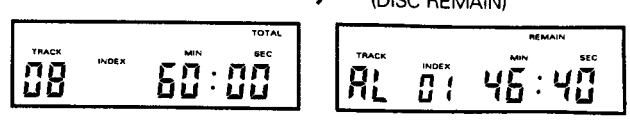
B: Remaining time of the song being played back (TRACK REMAIN)



TIME

D: Total playback time (TOTAL)

C: Remaining time of the disc being played back (DISC REMAIN)



4. DISASSEMBLY

• Use of 13P F.F.C. for Service

When servicing the unit (adjusting the pickup assy or repairing the head board assy) after setting the head board assy in a standing position (Fig. 1) by inserting it into the P board holder (PNY - 405), use 13P F.F.C. to connect the head board assy and the spindle motor.

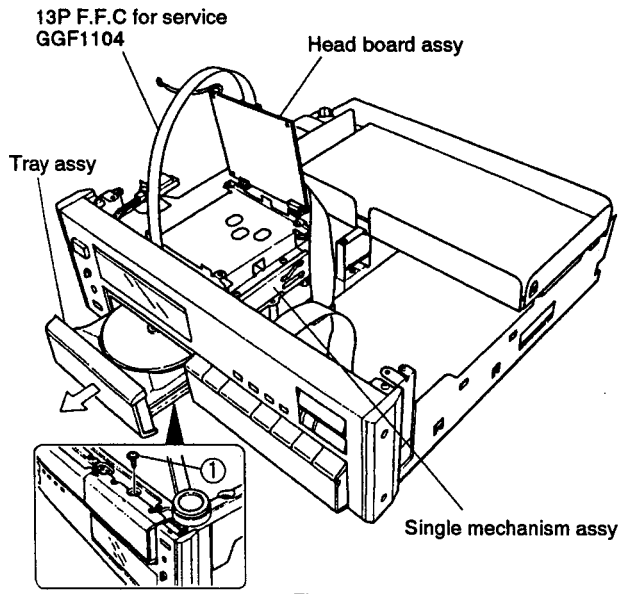


Fig. 1

• Removing the Tray Assy

1. Turn on the power and press the OPEN/CLOSE button to open the tray assy.
2. Remove the fixing screw ① of the tray assy (Fig.1).
3. Grip the tray by hand and slowly pull it out from the unit.

Notes 1 To open the tray manually

- You can slowly pull out the tray assy as long as the servo mechanism assy is not in its lower disc-clamp position. Be sure to turn off the power before pulling on the tray.
- If the tray does not move or stops part way when you try to pull it out, follow the procedure below to set the servo mechanism assy to its upper position where the disc is not clamped.

1. Remove top plate R (fixed by a screw ②), then top plate F (fixed by a screw ③). (Fig. 2)
2. With both hands, push on the cams ④ (one each on the right and left) of the single mechanism assy, at the position indicated by arrow Ⓐ in Fig. 3 (the position is the same with the other cam), fully towards the front panel.

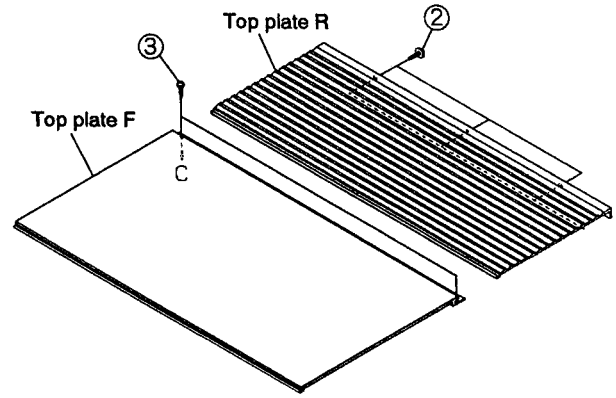

Fig. 2

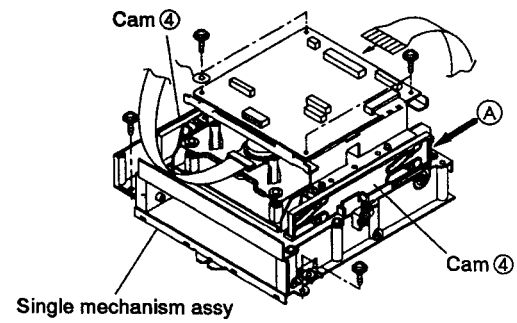

Fig. 3

3. Slowly pull out the tray assy to open.

• Removing the Servo Mechanism Assy

1. Solder and short - circuit between the patterns in block Ⓑ of the PU flexible board of the pickup assy.
2. Disconnect connectors Ⓒ to Ⓖ of the head board assy.
3. Disconnect earth lead Ⓗ (fixed by a screw).
4. Remove the mechanism cover ⑦ (fixed by two screws each on the left and right) while leaving the head board assy in place.

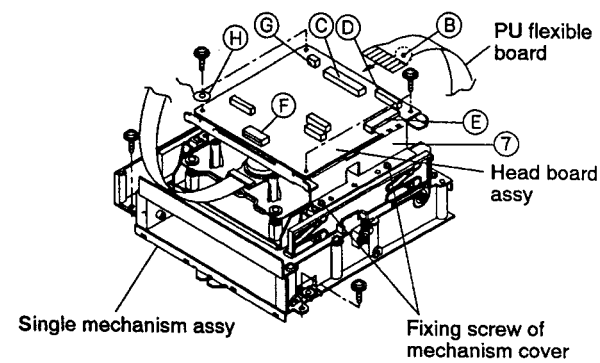

Fig. 4

5. Remove the four fixing screws ⑧ of the servo mechanism assy (Fig. 5).
6. Pull up and remove the servo mechanism assy, taking care not to lose its float springs.

Note: The four float springs are of different colors for their respective mounting positions. When reassembling, note the correspondence between the colors and the positions. Be careful not to damage the PU flexible board, as it is not secured in place.

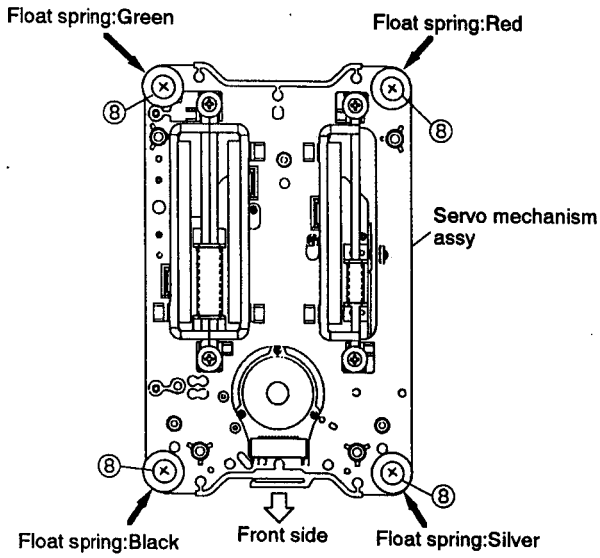

Fig. 5

• Removing the Pickup Assy

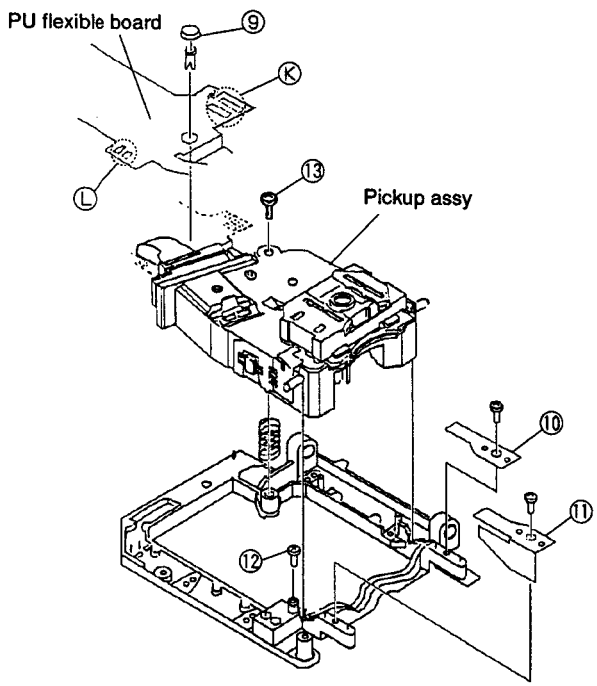

Fig. 6

1. Disconnect the lead wires of the drive coil and speed-detection coil, which are soldered to blocks Ⓚ and Ⓛ of the PU flexible board.
2. Remove the rivet ⑨ which holds the PU flexible board.
3. Remove plate springs S ⑩ and L ⑪ (each fixed by a screw and screw ⑫).
4. Remove the adjustment screw ⑬.

• Removing the Audio Board Assy

1. Remove top plate R, top plate F, the right and left side boards and the rear panel to obtain the condition shown in Fig. 7. (A 2-mm diagonal hexagonal wrench is required to remove the side boards).
2. Disconnect the all connectors connected to the audio board assy and connector Ⓡ of the power supply board assy.
   (Remove connector Ⓡ by pinching it with the fingers.)
   Loosen cord holder and remove wire.
3. Remove the seven fixing screws of the shield case and slowly pull up and remove the shield case (audio board assy).

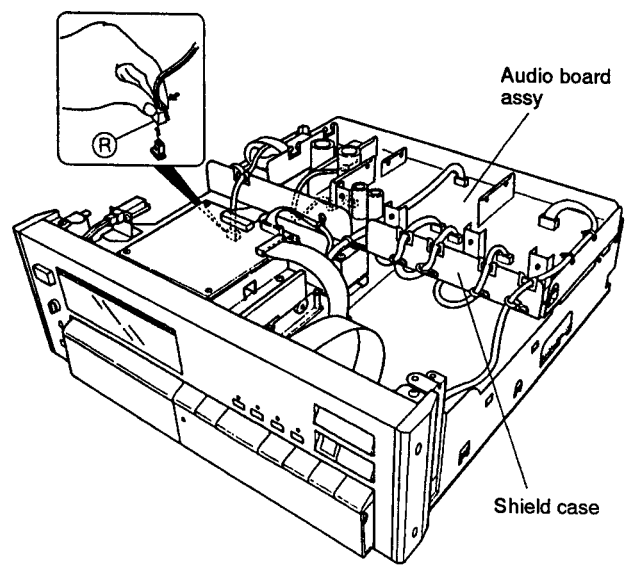

Fig. 7

5. CIRCUIT DESCRIPTION

5.1 CD-R DISC

As shown in Fig. 5 - 1, the disc for CD-R (compact disc recorder) is constructed from a resin board as base, with a recording layer, reflection layer, and protection film made from pigment film respectively layered on top. Guidance slots called "grooves" are cut into the top of the disc. When a strong laser beam is applied to these grooves during recording, the pigment quality changes and generates a recording pit. These grooves also have "wobble" or surges in the constant frequency which serves as the base for control of the number of disc revolutions. This wobble undergoes FM modulation to allow you to obtain information such as the absolute time of the disc.

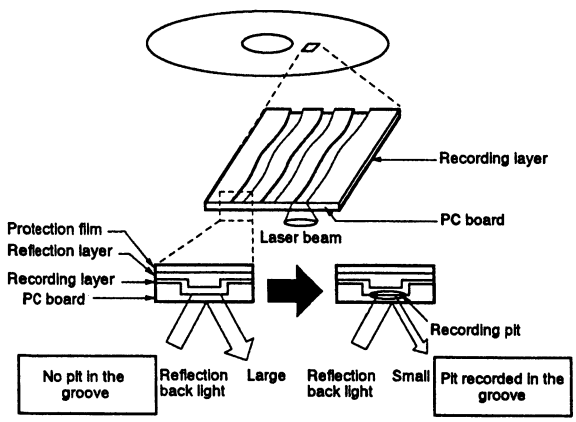

Fig. 5-1

objective lens where it is again converted into parallel light. The light then passes through the reflection and quadrangular prisms to the convex lens. It then continues on to the multi lens where astigmatism occurs after which it enters the 8 divided photodiode. The center section of the photodiode sectioned into 4 divisions creates the information and focus signals, and all three sections combine to create the tracking signal as is shown below.

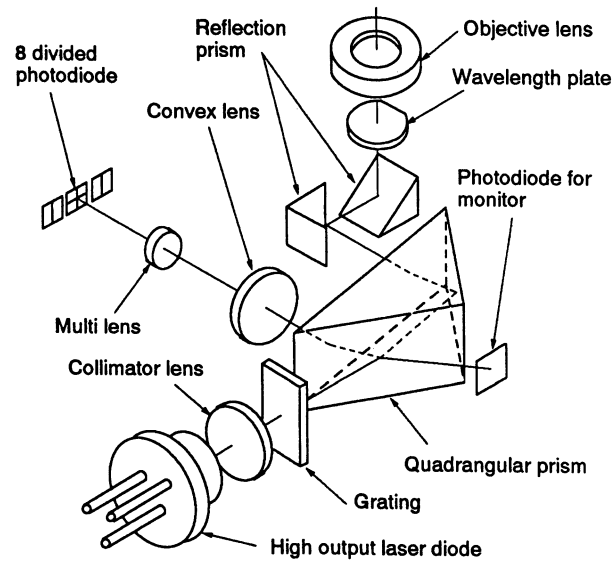

Fig. 5-2

5.2 PICKUP

5.2.1 Optical Path in the Pickup

The interior of the pickup is configured as shown in Fig. 5 - 2. The difference between a normal CD pickup and pickup for recording is that the recording pickup has an optical system that has an infinite amount of lines in order to increase the emission power of the objective lens, and that a high-output type laser diode is used.

The following is an explanation of the flow of light using the optical path diagram as a guide. First, the light emitted from the laser diode is converted into parallel light by a collimator lens. It then passes through a grating and is divided into three beams which proceed toward the quadrangular prism. A portion of the beams enter the quadrangular prism and spread into an ellipse after refracting from the plane of incidence of the prism. The remainder of the beams is reflected to the photodiode for monitor and used to control the laser diode power.

The light that passes through the quadrangular prism proceeds through the two reflection prisms and wavelength plate to the objective lens where it is converged on three spots on the disc.

The light is then reflected from the disc and back to the

5.2.2 Servo System

The law of astigmatism is used by a focus servo in the same manner as with a normal CD, however this unit cannot use the 3-beam method used in a CD in relation to the tracking servo. The reason being that the 3-beam method requires the servo to read the bright light on a disc, and the servo cannot read a disc that is completely light before recording. As a result, the push-pull configuration shown in Fig. 5 - 3 is used in the pickup of existing compact disc recorders. A push-pull configuration uses the light diffracted from the grooves back to photodiode to acquire tracking signals by taking the difference of the left and right of the returned light. However, offset occurs in one of the push-pull signals through the curve of the disc or fluctuations that follow the objective lens. To eliminate the offset, this unit uses the tracking system shown in Fig. 5 - 4. This system eliminates offset using the "differential push-pull method" which mixes the push-pull signals from the three light beams.

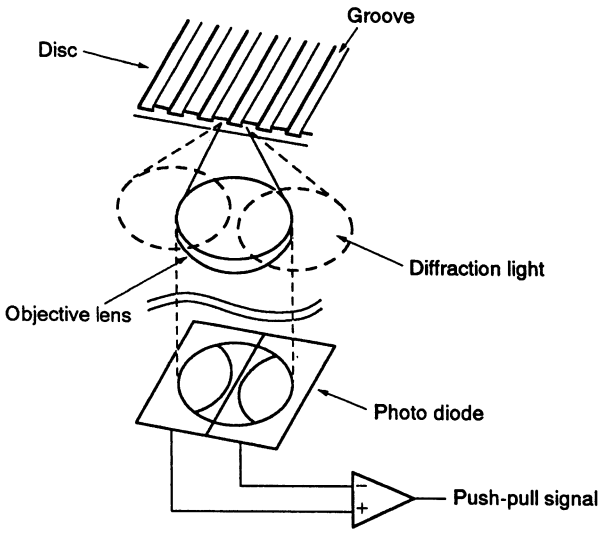

Fig. 5-3

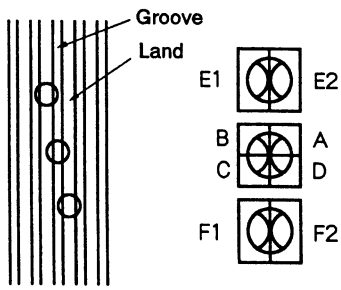

Beam position on the disc PD shape

$$TE = [(A + D) - (B + C)] - \frac{K}{2}[(E2 - E1) + (F2 - F1)]$$

(K=0 – primary light ratio)

Fig. 5-4

5.3 SERVO SECTION

5.3.1 APC

Control of the laser power varies according to the operation mode (playback or record). In playback mode, this unit basically uses the same APC (Automatic Power Control) as a CD player, but in recording mode, a different APC is used.

In playback mode, the signal that detected the output power of the pickup's laser diode is input from MD (pin 23) in the RF amp IC (IC101: PA4020A), converted from current to voltage (I/V), and amplified. Next, this signal is compared with the VR103 voltage determining the playback power and the resulting signal is input to the voltage-current (V/I) conversion circuit configured with the operation amp and Q102 and Q110 and added to the laser diode. The laser power is normally constant in regard to temperature fluctuations because the circuit works so that the detection current of the monitor diode is constant, the laser power is always constant in regard to temperature fluctuations.

In recording mode, the laser power necessary for recording is generated only when creating a pit with the APC during playback working. However, so that level fluctuations in the servo signals do not occur during recording, this unit is constructed to operate the playback APC on a laser power signal when the sample hold circuit of the RF amp IC has not created a pit.

It is necessary that the recording power be separately maintained at the most suitable value due to fluctuations caused by dispersion on the disc (OPC adjustment). This value is converted into voltage by the D/A converter

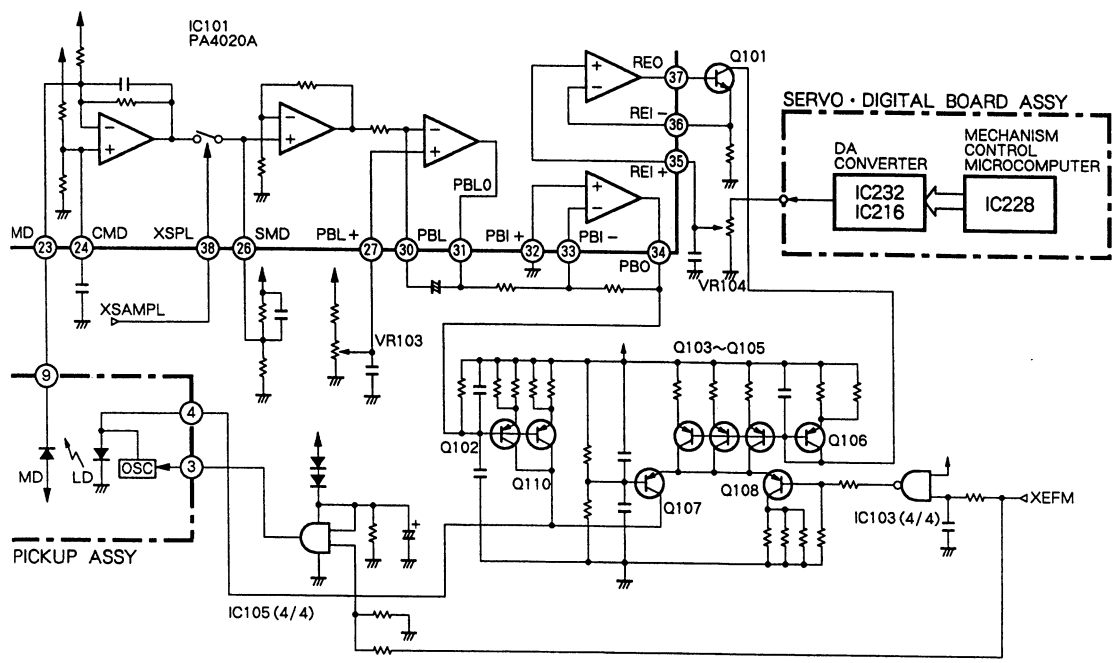

Fig. 5-5 Periphery APC circuit

configured from IC232 and IC216, and input from the mechanism-control microcomputer (IC228: UPD78323GJ - 5BJ) in the Servo•digital board assy to the operation amp in the RF amp IC and the Q101 V/I conversion circuit. The current is then amplified by the mirror circuit configured from Q103 through Q106 and added to the laser diode from the collector in Q107. This current is controlled (ON/OFF) from IC103 and Q108 with the recording signal from the EFM encoder IC (IC311: LC89583) and creates a pit string on the disc.

High frequencies are normally applied to the laser diode in an ordinary CD player, however to protect the laser diode in this unit, a high frequency is not applied when recording power outputs timing via IC105.

5.3.2 Error Signal Generation Circuit

The pickup has one main beam 4-division detector and two sub-beam 2-division detectors that use the 3-beam differential push-pull method. The output current is converted into voltage (I/V conversion) every output as shown in Fig. 5 - 6 in order to generate HF, RF, wobble, focus error, and tracking error.

The signals output from detectors A, B, C, D, E1, E2, F1 and F2 are input to pin 14, pin 22, pin 19, pin 17, pin 20, pin 21, pin 16, and pin 15 of RF amp IC respectively, converted from current into voltage (I - V), and directed to the sample hold circuit. The sample hold circuit is designed to stabilize and create each error signal during recording. When a pit has not been created, the sample hold circuit performs sampling, and when a pit has been created (when the laser emits recording power), it holds sampling.

After sampling hold circuit output has been amplified, the HF, RF, and focus error signals are generated by computing the main beam output in the same manner as a CD player. These signals are then output to pin 66, pin 68, and pin 55 respectively.

As shown in Figu. 5 - 7, the offset of a focus error signal is adjusted by VR105 connected to pin 56, and the offset fluctuations caused by temperature are cancelled by the R148 temperature compensation resistor.

As shown in Fig. 5 - 8, a tracking error generates main and sub beam push-pull signals by adding and subtracting these signals. The light balance of the main and sub beams is adjusted by VR110 connected to pin 48 and output to pin 49. After the gain and offset of this output have been adjusted by VR111 and VR112 respectively, the output is re-input to the RF amp IC from pin 50, and amplified. Finally, the signals are output to pin 51 in the following form.

$$[(A+D) - (B+C)] - K[(E2 - E1) + (F2 - F1)] / 2$$

(K=0 - primary light ratio)

The wobble generation circuit is shown in Fig. 5 - 9. Wobble signals are computed from a main beam as [(A+D) - (B+C)] and output from pin 61. Also, the auto balance circuit works to acquire quality wobble signals in order to prevent against an inferior C/N because the left and right balance is broken due to disc eccentricity or optical axis aberration and the RF must be cancelled.

This circuit passes the previously-stated computed output through the inversion amp whose band is limited to the maximum frequency of the eccentricity. The circuit is configured to feed back this output to the voltage control resistor (IC102: CXD7500M) which is connected to the computation circuit on the first stage.

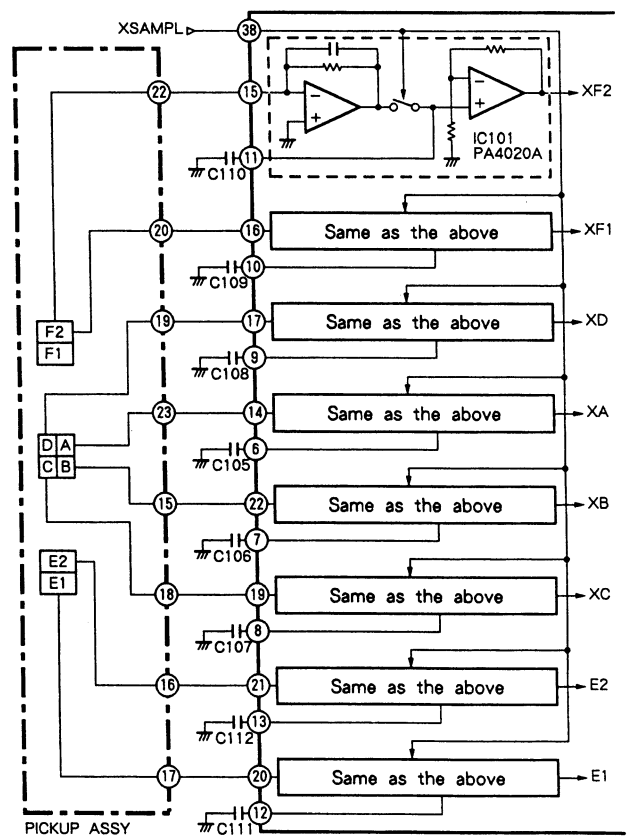

Fig. 5-6 I/V Conversion circuit

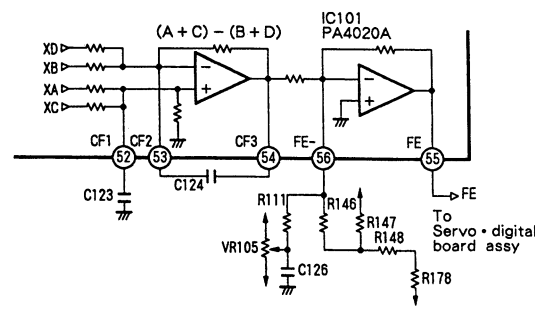

Fig. 5-7 Focus error generation circuit

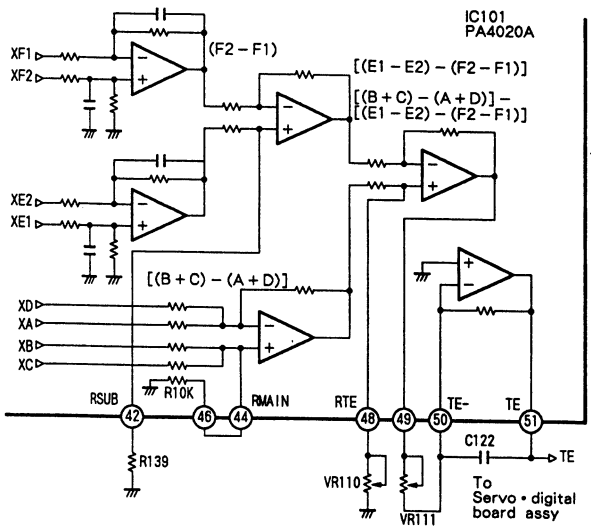

Fig. 5-8 Tracking error generation circuit

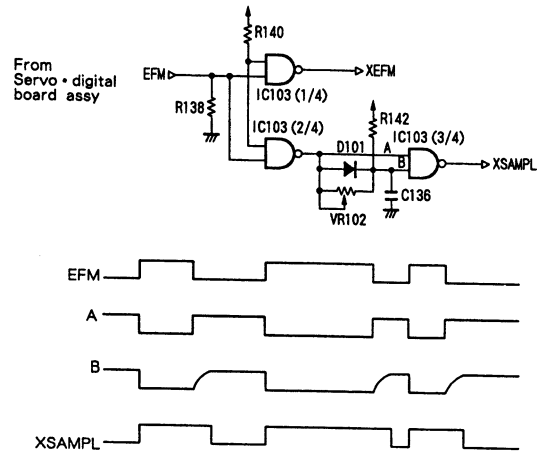

Fig. 5-10 Sample hold pulse generation circuit

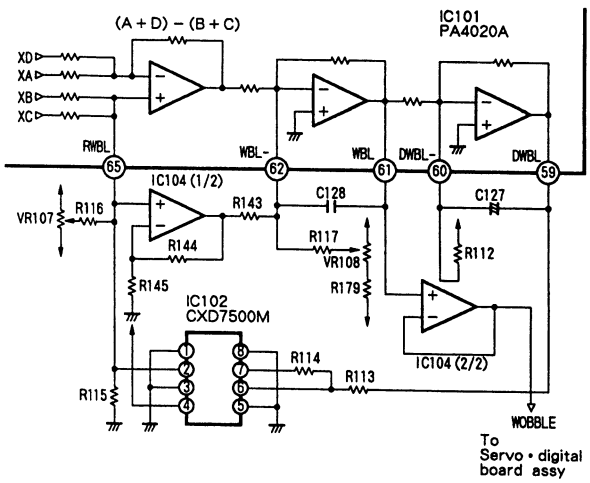

Fig. 5-9 Wobble generation circuit

5.3.3 Sample Hold Pulse Generation Circuit

In recording mode, the laser power is at a recordable level only when pits have been created. This helps to avoid a normal servo when the light reflected from the disc changes in pit creation and playback level modes. A sample hold method, which uses a signal in playback level mode only, is used to counter the problem of different levels of reflected light.

The sampling pulses are L level signals that span from 500 nsec after the falling edge to the rising edge of the recording EFM signal. The waveform of the recording EFM signals made in the Servo • digital board assy are shaped by IC103 (1/4). Some of the signals are directly input to the NAND gate [IC103 (3/4)] through the CR circuit, but the remainder are delayed in regard to the EFM signal and then input. This output is input to pin 38 of the RF amp IC as XSAMPL of the sample hold pulse.

5.3.4 Focus Servo

As shown in Fig. 5-11, the focus servo system of this unit is identical to that of a CD player. The error signals created by the RF amp IC are directed to the Servo•digital board assy through CN106. The loop gain of these signals is adjusted by VR201 and they are input to FXC (pin 46) and FE (pin 47) in the CD servo control IC (IC201: CXA1372Q). These signals are then output from FEO (pin 5) through the defect countermeasure and phase compensation circuits in the IC. Next, this output is directed to the Head board assy and added to the focus actuator drive coil by the power operation amp (IC106: LA6517).

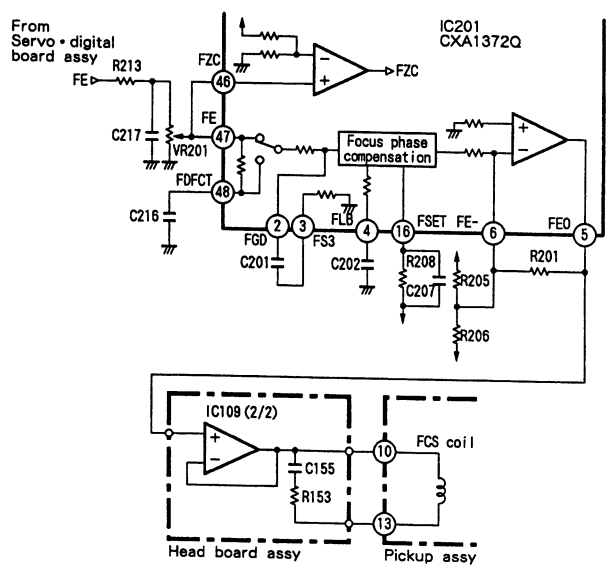

Fig. 5-11 Focus servo circuit

5.3.5 Tracking and Sled Servo

As shown in Fig. 5 - 12, the tracking servo system of this unit is identical to that of a CD player except that gain adjustments are controlled from the mechanism - control microcomputer. Error signals generated by the RF amp IC are directed to the Servo • digital board assy through CN106 and input to the variable gain amp configured from IC202 and IC203 (1/2). This supports TRK error gain dispersion on each disc and provides the best loop possible. For the gain settings, the tracking servo should be open and the control signals input to pin 9, 10, and 11 of IC202 is sequentially changed by the mechanism-control microcomputer. As a result, amplification of the tracking error output of IC203 (1/2) is also sequentially changed. The output is then clamped to a constant direct current level by the circuit consisting of IC211(1/2), C272, and D203, converted into direct current voltage by IC221 (2/2) half wave rectifier, and input to the mechanism-control microcomputer. The criterion level varies according to the disc type used, however the IC202 control signal is set so that the gain is determined by the microcomputer at the optimum level in relation to the voltage.

The output from the variable gain amp adjusts the loop gain via VR202 and is input to TE (pin 43) of the CD servo control. This output is then passed through the defect and phase compensation circuits in the IC and output from TAO (pin 11). Next, the output is directed to the Head board assy and added to the tracking actuator drive coil from the power operation amp (IC106 : LA6517).

TAO output passes through the low-pass filter (LPF) and into SL + (pin 13) of the CD servo control IC. A linear motor allows for this output to also be used as input for the sled servo system, just as in the setup of a normal CD player. The slider control signals output from SLO (pin 14) are directed to the Head board assy via CN201, and input to IC107 (1/2) in the speed control loop. In IC107 (1/2), the gain and phase compensation for the speed control loop is performed, the circuit offset is cancelled by VR101, and this output is added from the driver IC [IC109 (1/2)] to the linear motor coil in the slider.

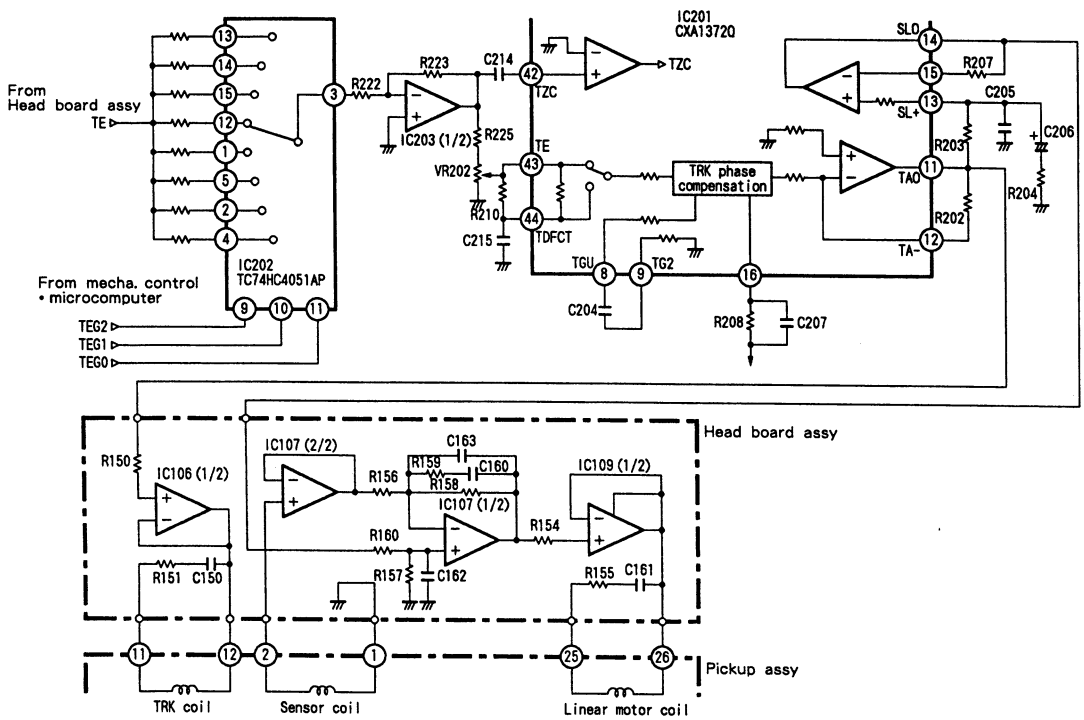

Fig. 5-12 Tracking servo circuit

5.3.6 Spindle Servo

A block diagram of the spindle servo is shown in Fig. 5-13. The spindle motor controls are individually controlled during recorded section only playback mode, blank (unrecorded) section playback mode, recording mode and disc revolution change mode as described below.

First, control in recorded-section-only playback mode is identical to that of a CD player. RF signal generated by the RF amp IC are directed to the Servo•digital board assy through CN106 and input to RFI (pin 39) of the CD servo control IC. The input RF signal is converted into binary signals by a comparator and output to EFM (pin 32), after which they are input to RF (pin 24) of the CD decoder IC (IC225: CXD2500BQ) where MDS and MDP error signals are generated from sync and internal reference signals (including EFM signals). Processing by this IC is completely digital. The final step in creating a spindle control signals is when a ternary PWM signal is output to MDP (pin 4) and the carrier portion is removed by the IC203 (2/2) filter.

Next, blank section playback and recording modes do not have the sync signal mentioned above, instead the disc revolution control signal known as "wobble" is read from the grooves cut into the disc. Also, ATIP (absolute time information processing) can be acquired from these signals as described below.

After setting the number of spindle motor revolutions to the desired speed using CAV (Constant Angular Velocity) speed which uses PWM output from the mechanism - control microcomputer, the servo is changed to the spindle servo using the wobble. The wobble servo directs the wobble signals generated by the RF amp IC to the Servo • digital board assy via CN106, and the unnecessary portions of the signal are removed by the 22.05 kHz band-pass filter (BPF) configured from IC219 and IC220 (1/2).

Next, the signals are converted to binary by a comparator [IC207 (2/2)] and input to WOBBLE (pin 21) of the ATIP decoder IC (IC222: G307PA23).

The 4.3218 MHz supplied from the EFM encoder IC serves as the master clock signal. This IC compares the phases of the master clock signal divided into 22.05 kHz and the wobble signals above, and then outputs binary PWM signals. The final step in creating a spindle control signal is that the carrier in the output is removed by the IC221 filter and simultaneously subjected to phase and gain compensation.

In addition to the wobble servo, the ATIP decoder IC demodulates information from wobble signals such as the ATIP sync, absolute time, recommended recording power, lead-in area start time, lead-out area start time, and desk applications and sends the signals to the mechanism - control microcomputer.

To suddenly change the revolution speed of the spindle motor through start, stop, or search operations, the unit changes to CAV with the mechanism-control microcomputer. The microcomputer counts the FG signals that can be acquired from the spindle motor which enables the unit to go to the desired revolution speed in a short time due to the acquisition of the current revolution speed information.

It is necessary to control forward/reverse as the spindle driver IC (IC108 : LB1687) does not have a speed reduction function. A polarity discriminating/inverting circuit consisting of IC223 and IC224 (1/2) as shown in Fig. 5-14 is necessary because of the polarity of a normal spindle control signal is erroneous in regard to the reference voltage.

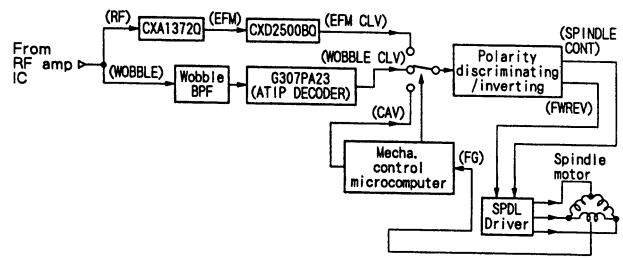

Fig. 5-13 Spindle servo block diagram

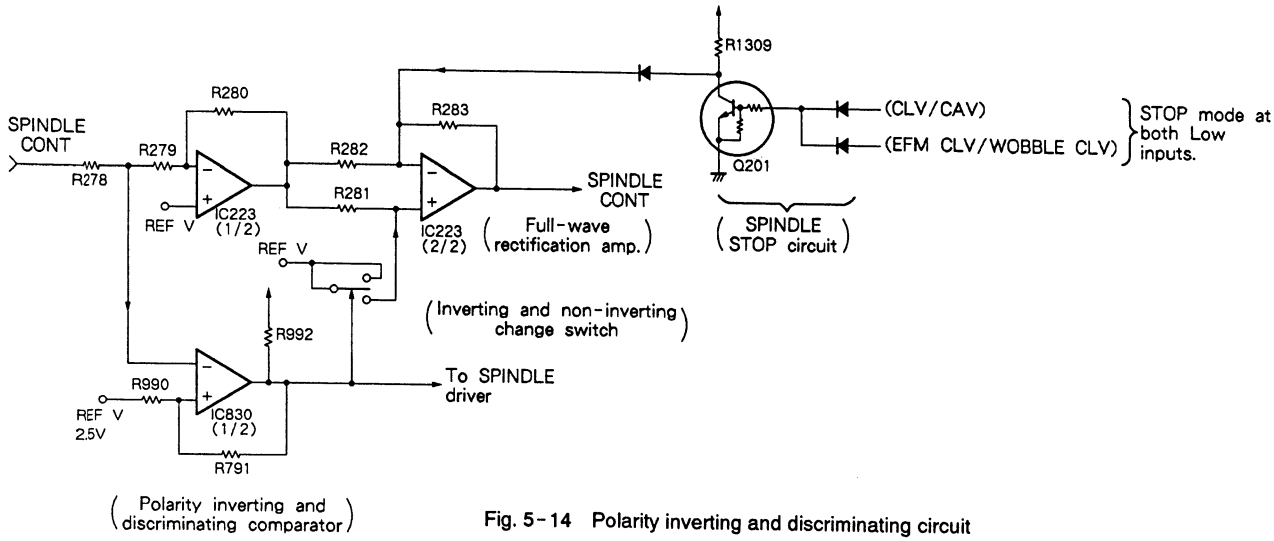

Fig. 5-14 Polarity inverting and discriminating circuit

Positive polarity increases and negative polarity decreases the speed according to the reference voltage, so the reference voltage is compared with the spindle control signal using IC224 (1/2). IC223 (2/2) becomes the inverting amp in speed decrease mode only so that the positive control signal inverts to a negative when the switch (IC217) is changed and a polarity discriminating signals are input to FRC (pin 27) in the spindle driver IC.

5.3.7 Defect Circuit

After inverting the RFI signal, the defect circuit performs bottom hold using a long and a short time constant. The bottom hold performed by the short time constant sends a response at a mirror surface defect on the disc that is 0.1 ms or longer. The bottom hold performed using the long time constant continues holding the mirror surface at the level preceding the defect. These signals are differentiated with an AC coupling and their level is shifted. A mirror-side defect signal is generated by comparing both signals. The resulting signals is used to mute a tracking error and hold the values preceding a focus and spindle error when the DEFECT output is H to improve the playability.

The circuit block diagram is shown in Fig. 5-15 and each waveform is shown in Fig. 5-16.

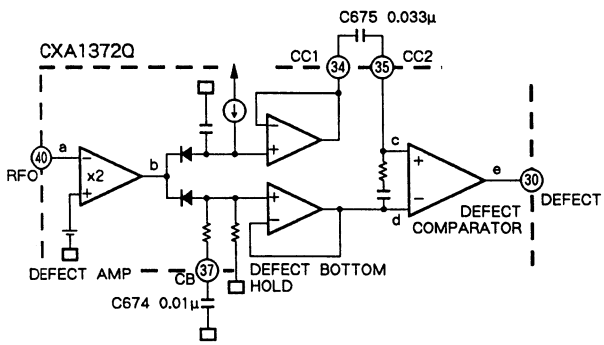

Fig. 5-15 DEFECT circuit

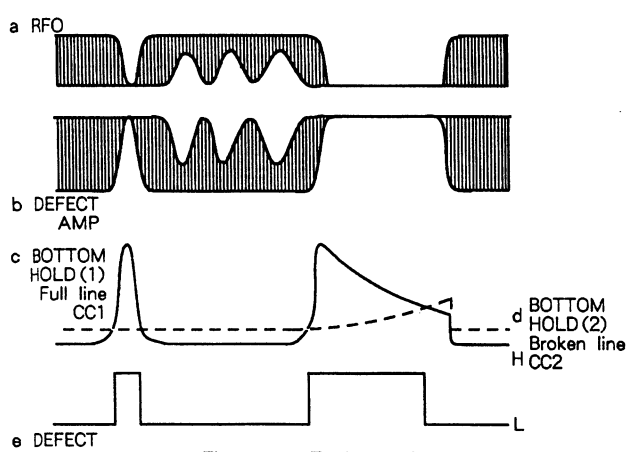

Fig. 5-16 Each waveform

5.3.8 EFM-PLL

To demodulate played EFM signals when "T" is the channel clock cycle, a channel clock signal is necessary due to modulation of the "T" integer from 3T to 11T. Actually, a PLL is necessary to playback a channel clock signal because of the non-uniform revolution of the spindle which changes the pulse width of the EFM signals.

As shown in Fig. 5-17, a portion of the EFM signals input to RF (pin 24) of the CD decoder IC (IC225: CXD2500BQ) pass through the internal buffer and are output to ASYO (pin 27). In order to correct the asymmetry of the disc, these signals then pass through the low-pass filter configured from R918, C293, R919, and C294, and are input to ASY (pin 31) as reference voltage for the EFM comparator in the CD servo control IC.

The remainder of the EFM signals are directed to the CD decoder IC inside of the PLL. There are three levels of PLLs in the IC as shown in Fig. 5-18. The PLL on the first stage is not used for varied pitch playback. The PLL on the second stage is used to create a high-frequency clock signal necessary for the PLL on the third stage. The PLL on the third stage is a digital PLL designed to playback actual channel clock signals. It maintains a capture range of ±150kHz or more under normal conditions.

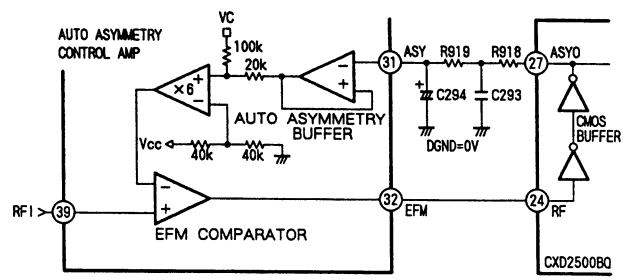

Fig. 5-17 EFM comparator circuit

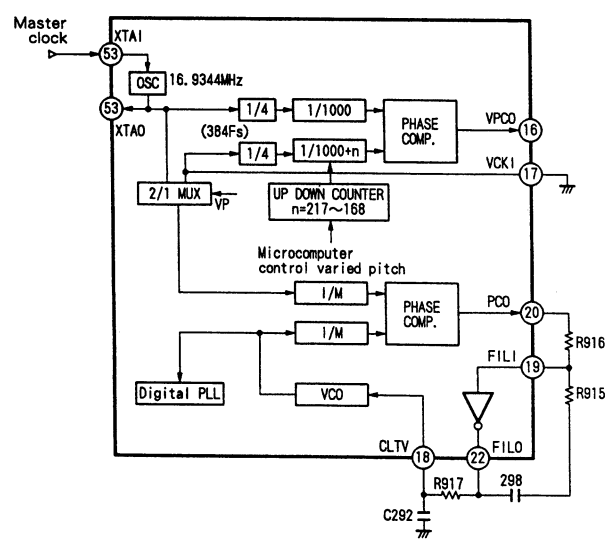

Fig. 5-18 EFM-PLL block diagram

5.3.9 RF Detection

This unit detects whether or not there are RF signals in order to determine the recorded and blank sections on a CD - R.

HF signals generated by the RF amp IC are directed to the Servo•digital board assy via CN106, and input to the peak hold circuit consisting of IC206 (1/2) and Q204 through Q207, and the bottom hold circuit consisting of IC206 (2/2) and Q209 through Q212 respectively. The two output signals pass through the differential amp [IC210 (1/2)] and are compared to the reference voltage by the comparator IC [IC207(1/2)]. The XRFDT is output to the mechanism-control microcomputer as L when an RF signal is present, and H when an RF signal is absent.

During setup, these signals are used in the TOC area to distinguish whether the disc is a TOC recording only disc (including CDs) or a disc before TOC recording. In recording mode, these signals are used for retrieval of the newly recorded area and to prevent against write-over.

The RF peak hold signals (RFT) and RF bottom-hold signals (RFB) used in OPC (optimum recording power calibration) operation are separately provided with circuits having time constants corresponding with OPC operation. Using IC213 and IC214 of the comparator and IC215 of the operation amp, the output can be acquired from the input HF signals. These detection signals are sent to the mechanism-control microcomputer.

OPC operation uses the first 4 out of the 5 bits detailed in Section 5.3.1. After recording in 15 steps, the difference of the RF peak and RF bottom signals is calculated during playback of the 4-bit section and the DA converter output level for the best possible recording is determined. During actual recording, recording with best output power is possible by selecting and supplying the output voltage closest to the set voltage using 5-bit accuracy (31-step).

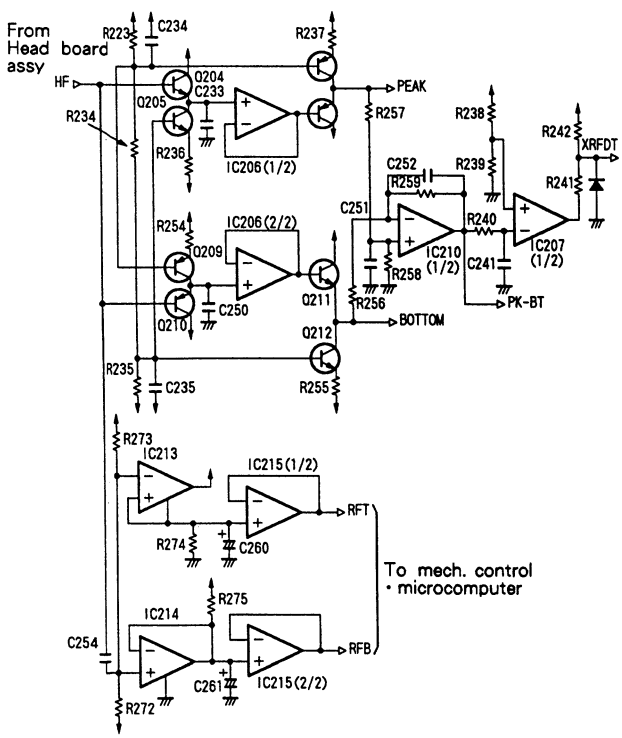

Fig. 5-19 RF detection circuit

5.3.10 Mirror Circuit

The mirror circuit block diagram is shown in Fig. 5 - 20 and the circuit diagram in Fig. 5 - 21. The mirror circuit uses a circuit unique to the CD - R and is switched with the previously mentioned RF detection signals as described below. This circuit employs RC (radial contrast) which is generated in the recorded areas by a generation circuit just as in a CD player, and in the unrecorded sections by cross-cutting the grooves on the disc.

In the blank area, peak hold signals (RC: radial contrast) acquired by the RF detection circuit are AC coupled and amplified. A mirror signal for the CD - R can then be obtained by comparing the integrated signal with a comparator [IC209 (1/2)] as reference voltage.

In the recorded area, the differential amp output of the bottom hold signal and peak hold signal used for RF detection is used. A mirror signal can then be obtained by comparing the output that has been subjected to half-wave rectifying with a comparator [IC209 (2/2)] as reference voltage.

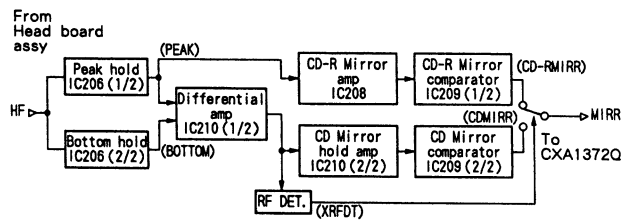

Fig. 5-20 Block diagram of Mirror circuit

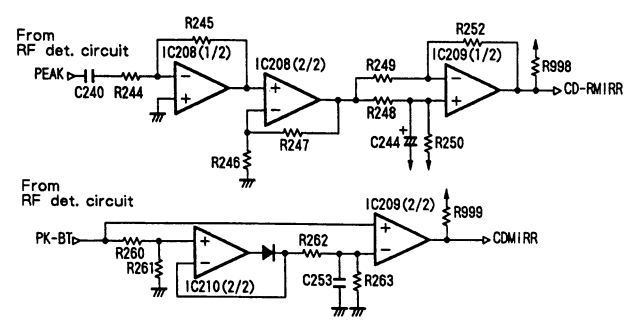

Fig. 5-21 Mirror circuit

5.4 AUDIO SECTION

5.4.1 Analog Input Circuit/Recording Volume Controls

The analog signals input from the JA802 (Lch) pin jack go through the input buffer amp (IC801) and into the VOL. board assy via CN801. These signals then pass through the recording balance volume (VR801) and recording level volume (VR802) controls and proceed into the volume amp (IC806) where they are amplified by about 20 dB. Finally they are input to the Audio board assy again via CN803.

5.4.2 AD Converter

The circuit diagram of the AD converter (IC804: CS5339) is shown in Fig. 5-22.

AINL (pin 2) and AINR (pin 27) are the analog input pins of the left and right channels respectively. ZEROL (pin 3) and ZEROR (pin 26) are the zero level input pins for offset calibration of the left and right channels respectively. Only the left channel is shown in Fig. 5-22. The 160 mV that splits 5V in the zero level input pins with R814 (1.5 k Ω) and R818 (51 Ω) is input. Signals from the VOL. board assy are biased to the 160 mV above by R810 and input to the driver amp (IC807). The driver amp output passes through the R812 and R816 resistors and into AINL of the AD converter where it is subjected to AD conversion.

The 384Fs master clock, 32Fs serial clock, and LR clock signals are input to CLK (pin 20), pin 15, and pin 14 respectively from the Servo • digital board assy via CN802 as AD converter control signals. Fs is 44.1 kHz. The 128Fs obtained by splitting the master clock signal input to CLK into three divisions is output from OCLK and input to the analog section of ICLK. The 64Fs is obtained by splitting this signal into two parts after which it becomes the sampling rate.

The AD converted data is output from SDATA (pin 16) and input to the Servo•digital board assy via CN802. The relationship between each clock and the data is shown in Fig. 5-23.

In all operation modes other than analog recording mode, APD (pin 6) and DPD (pin 10) are set to H to go to power down mode. In analog recording mode, these connectors are set to L to calibrate the analog and digital sections.

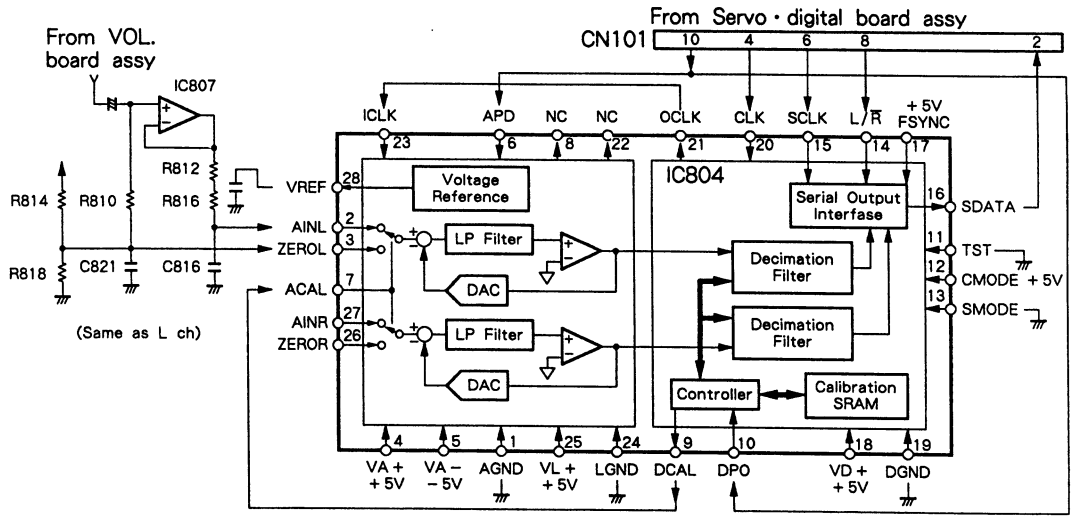

Fig. 5-22 AD converter circuit

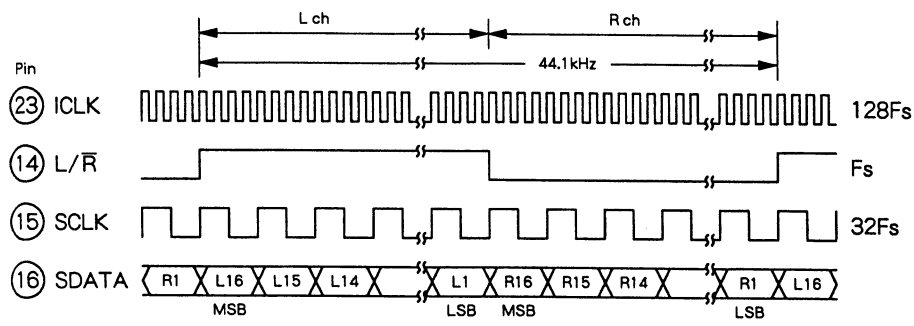

Fig. 5-23 Data output timing of AD converter

5.4.3 DA Converter

The circuit diagram of the differential amp and left channel of the DA converter (IC407: PD2029A) is shown in Fig. 5 - 24. In the DA converter, the 16-bit DATA, BCK, and LRCK are input from the Servo • digital board assy to DATA (pin 25), BCK (pin 26) and LRCK (pin 27) respectively via CN405 connector.

Also, 384Fs (Fs=48, 44.1, or 32 kHz) is input from the master clock selector to XI (pin 13) via the IC417 buffer as the master clock signal.

To set the operation mode of the DA converter, DACDT, SHIFT and LDALT serial data from the C-bit microcomputer is input from the Servo•digital board assy to MUTE (pin 22), EM2 (pin 21) and EM1 (pin 20) respectively via CN404. The contents of the data are shown in Table 5 - 1, and the serial input transfer timing is shown in Fig. 5 - 25.

This unit does not perform the attenuation and deemphasis or correspond with double speed mode. The input data is 16bit. To use the DA converter on one channel in speed mode, the IC settings are as follows: AT0 through 6 are all 1, μEM1 is 0, μEM2 is 1, HS is 0, BIT 1 and 2 are 0, MONO is 1, DFS is 0 and CHS is 0. To use the Rch (right channel) of IC408, CHS is set to 1.

The data input from DATA (pin 25) passes through the data input interface and the unnecessary noise outside of the waveband is removed by the 8-times oversampling FIR type digital filter. After the input has been filtered, the 8Fs data is directly doubled and oversampling of 16Fs is performed. Also, the dither circuit adds DC offset and dither to the data to prevent noise from the idling pattern specific to the $\Sigma\Delta$ modulation DA converter. After the dither has been added to the data, oversampling up to 384Fs is performed by the sample hold circuit.

The DA converter has built-in $\Sigma\Delta$ modulation DA converters for 2 channels (simultaneous output type). The output is bit stream output and the setup time (changing time) of the DA converters are 1/384Fs sec.

The output circuits calculate the resistance of the positive - phase output and negative-phase output that shifted the 384Fs data with the rising and falling edges of the clock signals. The phase is output from LO and $\overline{LO}$. Another channel of positive-phase output L1 and negative-phase output $\overline{L1}$ are combined with the above channels for a total of four output channels to achieve a higher signal-to-noise ratio in the DA converter output with a low distortion ratio by taking the diffential with the external operation amp (IC409). This operation amp also serves as the primary low-pass filter.

Output from the diffential amp (IC410) can be obtained also for the Rch in the same manner.

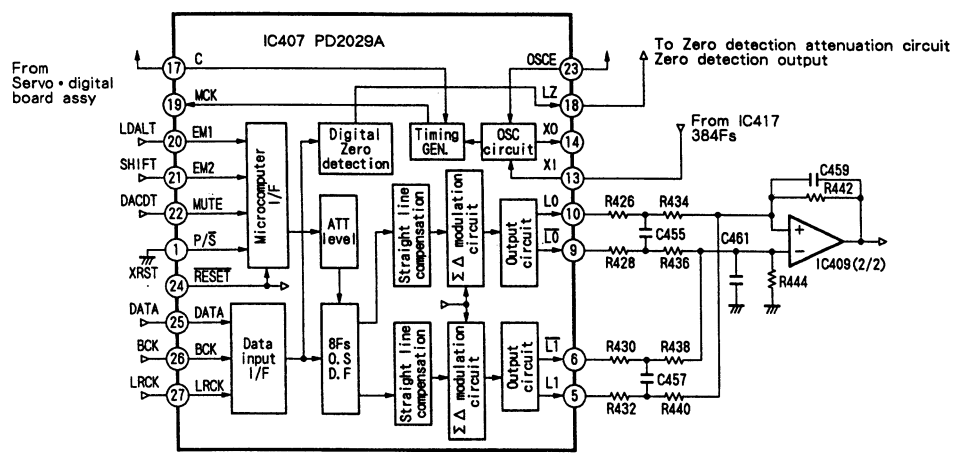

Fig. 5-24 DA converter circuit (PD2029A)

Table 5-1 Contents of serial input control

Serial input data	Control signal		
D7	0	1	
D6	AT6	0	1
D5	AT5	DFS	–
D4	AT4	CHS	–
D3	AT3	MONO	–

5.4.4 Analog Output Circuit

The circuit diagram of the Lch output buffer is shown in Fig. 5-26. As stated above, IC409 output is input to the inverting input pin of IC409 via R446, R448 and R458. The IC409 output is connected to the FET (Q413 and Q415) buffer. This buffer makes up the secondary low-pass filter with C465, C467, R448, R458 and R456.

The analog output circuit section has the following three responsibilities.

First, it serves as the deemphasis circuit. When playing discs on which a preemphasis has been placed, the DEEMP control signal goes to H and the Q411 transistor goes to ON. At this time, the deemphasis is placed by R446, R450 and C462.

Second, this circuit serves as the muting circuit. When the POWER switch is turned ON or OFF and the input selector is switched, the MUTE control signal goes to H, the Q419 muting transistor goes to ON, and the audio output is muted.

Third, this circuit serves as the zero detection attenuation circuit. This is designed to improve the signal-to-noise ratio when all of the data input to the DA converter is 0 (when there is no input). When the DA converter does not detect any signals, the ZERO control signal goes to H, the Q471 attenuate transistor goes to ON, and the audio output noise level is reduced.

Also, the buffer output near the muting is directed to the H.P. board assy.

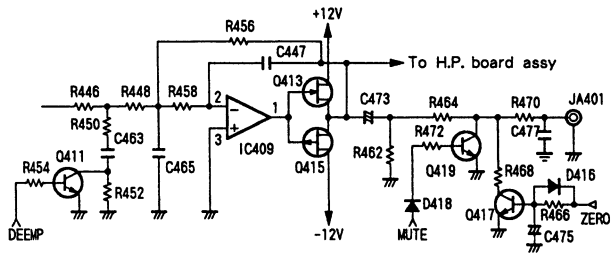

Fig. 5-26 Deemphassis, muting and zero detection attenuation circuit

5.5 Digital Audio Section

5.5.1 Digital Interface Demodulation Circuit

This unit has four systems of digital input: one coaxial (COAX) and three optical (OPT). The waveform of COAX input is shaped by the two inverters in IC302, output from pin 4 in IC302, and finally input to pin 2 of the digital interface decoder (IC301: M65810FP). OPT1, OPT2 and OPT3 input signals are converted photoelectrically using the JA302, JA301 and JA310 optical reception modules respectively, and input to pin 5, pin 6 and pin 7 of IC301. At this point, turn the power of the optical reception modules off when you wish to avoid noise during COAX input.

A block diagram of the digital interface decoder (M65810FP) is shown in Fig. 5-27. The input signals from pins 2, 5, and 6 are selected with the input changeover circuit. The preamble block detects the selected signals and generates the clock signals locked to the selected signals using VCO of the PLL circuit. The input signals are subjected to bi-phase demodulation through these clock signals, and the audio, C-bit, U-bit, and V-bit data are output. The selected signal is output from pin 1 as loop output.

The PLL is configured as follows. The output that compares the phases of the preamble and clock signals from the VCO that have been divided are output from PDO (pin 26), passed through the DC amp configured from the first inverter between pin 13 and pin 12 and the second

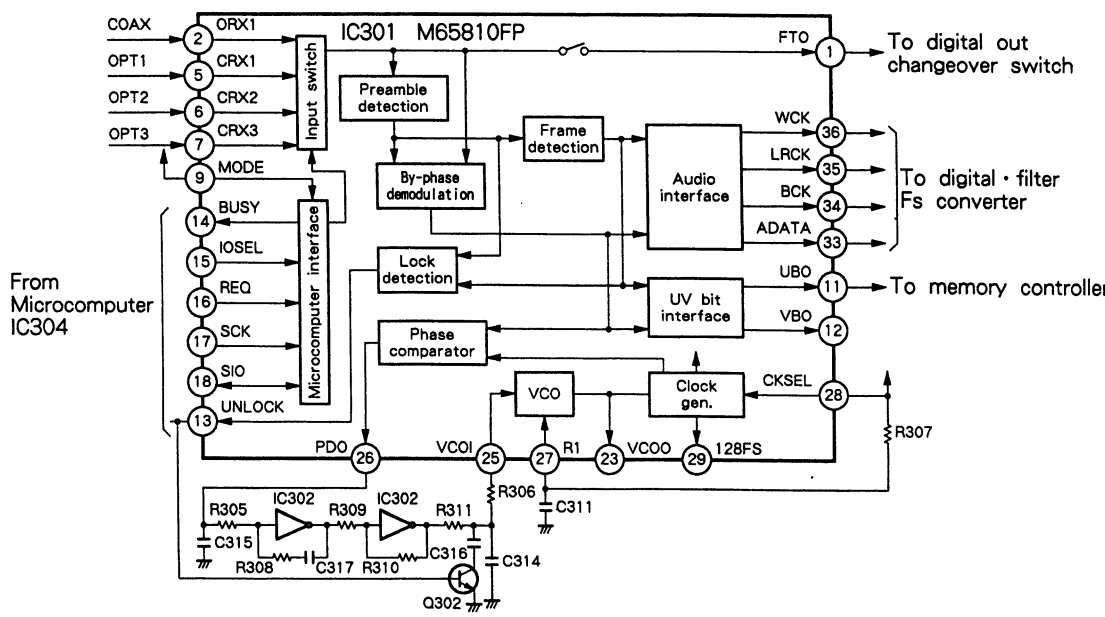

Fig. 5-27 Digital interface decoder(M65810FP)

inverter between pin 11 and 10 in IC302, and input from VCOI (pin 25) to the VCO. When the PLL is not locked, the UNLOCK signal from pin 13 goes to H and the Q302 transistor goes to ON. A pulse signal is then output to PDO and input to VCOI. As a result, the VCO sweeps between the low and high frequencies. In UNLOCK mode, the above data is not output.

The output timing of the audio data is shown in Fig. 5-28. LRCK, WCK, BCK and DATA are output from pin 35, pin 36, pin 34 and pin 33 respectively. BCK is 64fs, DATA is MSB first, binary, and 16-bit. This output is directed to the digital filter (IC312) and FS converter (IC307).

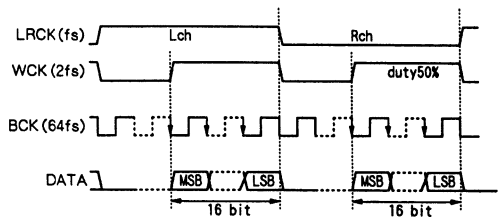

Fig. 5-28 Audio data output timing

This digital interface decoder is controlled by the C-bit microcomputer and the timing is shown in Fig. 5-29. In input mode (IOSEL: pin 15=H), SIO (pin 18) is read out at the falling edge of SCK (pin 17), and the input conversion and FTO (pin 1) control are performed with the last 4-bit data at the falling edge of REQ (pin 16).

The relationship between the data and each mode is shown in Table 5-2.

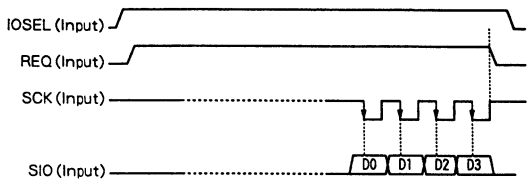

Fig. 5-29 Microcomputer control timing

Table 5-2 Data and setting mode

Receive input		D1	D2	D3
COAX	ORX1	H	H	H
(Not used)	ORX2		H	L
(Not used)	ORX3		L	H
OPT1	CRX1	L	H	H
OPT2	CRX2		H	L
OPT3	CRX3		L	H
Analog input mode		X	L	L

FTO	DO
ON	L
OFF	H

The timing that incorporates the first 32-bits of the C-bits from this IC into the C-bit microcomputer with serial data is shown in Fig. 5-30. In this figure, B of RX is the preamble shown at the front of the block. When IOSEL (pin 15) is L, SIO (pin 18) goes to output mode.

If BUSY (pin 14) is changed H in regard to the block in front of the first 32-bits of the C-bits, the signal will return to L if the contents of this block are the same as the block 2. Next, the first 32-bits in the C-bits are loaded in the register on the output side by the REQ (pin 16) reverting edge. When REQ is H, the C-bit is output from SIO follows SCK (pin 17) and input to pin 12 of the C-bit microcomputer (IC304). This unit performs readout every time transmission with the mode microcomputer is completed regardless of BUSY.

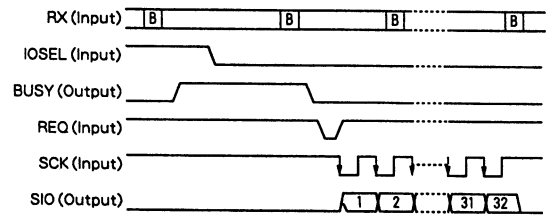

Fig. 5-30 Serial data output timing

The timing of the U-bit data output is shown in Fig. 5-31. U-bit data is output from UBO (pin 11) and input to pin 30 of the memory control IC (IC305). The figure below shows M and W of the RX reception signal as the Lch and Rch preamble respectively.

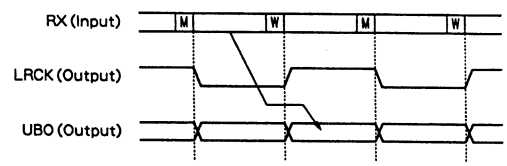

Fig. 5-31 U bit data output timing

The serial/parallel conversion circuit in the U-bit is shown in Fig. 5-32. UBO (pin 11) output of IC301 is input to pin 30 of the memory control IC (IC305). The serial/parallel conversion circuit in the IC shifts the input data in the shift register with the WCK input to pin 31. Output from the shift register is read out in the 8-bit storage register by ULAT once at 8 clocks. If the XUSEL output of the C-bit microcomputer (IC304) is L, the U-bit data in the storage register is output to pins 19 through 22 and 24 through 27, read out into pins 34 through 41 of IC304, and processed as such.

Also, the 8-bit data bus of IC304 and IC305 is a two-way bus. When the XUSEL output is H, the output from the mode microcomputer that has been converted from serial command to parallel is input as the control signal of IC305 and digital audio signal. It is then simultaneously output to pin 8 through 11 and 14 through 17 and read out in the IC305 command register at the rising edge of MLAT output (pin 32) of IC304.

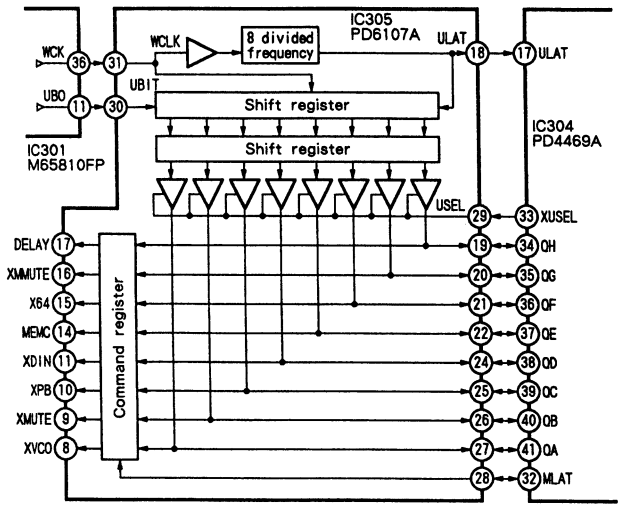

Fig. 5-32 Serial/paralle conversion circuit

5.5.2 Digital Filter

The output from the digital interface decoder is input to the digital filter and Fs converter (Fs=sampling frequency).

Refer to the section detailing the Fs converter for further information. The Fs is 32 kHz and 48 kHz due to the fact that output from this digital filter is used in sampling rate conversion mode only. DATA, BCK and LRCK are input to pin 1, pin 2 and pin 28 of the digital filter (IC312: SM5813AP) respectively and the 384 × Fs clock signal is input from VCOO (pin 23) of IC301 to XTI (pin 6) as the master clock signal.

As the digital filter output, the data from the left and right channels of the 8-times oversampling 20-bit are output from DOL (pin 24) and DOR (pin 23) respectively. The WCK and BCK synchronized with this data is output from WCKO (pin 25) and BCKO (pin 26) respectively. The timing of this output is shown in Fig. 5-33. The data and clock signals are input to the Fs converter IC (IC307) in present form and are subjected to sampling rate conversion.

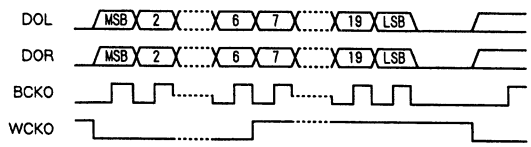

Fig. 5-33 Digital filter output timing

5.5.3 Fs Converter

The Fs converter (IC307: PD6093A) converts signals to CD format 44.1kHz digital data when the sampling frequency of the digital input is 48 or 32 kHz. To convert the data, the data sampled with 44.1 kHz is calculated from the digital filter output data that was subjected to 8-times oversampling of 48 kHz or 32 kHz.

Below is an explanation of the actual circuit as shown in Fig. 5-34. First, the output data from the digital interface decoder is input to EXDI (pin 37), EXBI (pin 38), EXWI (pin 39) and EXLI (pin 40). One portion of the data from the digital filter is input to BCK8F (pin 116), WCK8F (pin 117), L8FSI (pin 118) and R8FSI (pin 119). When the sampling frequency is 44.1 kHz, TRD (pin 96) goes to L and OSEL (pin 97) goes to H via FSC (output changeover of Fs converter) and the XFEN control signal output from the C-bit microcomputer (Fs converter is enabled with L). At this point, the signals input to pin 37, pin 38, pin 39 and pin 40 are output from DATAO (pin 32), XOUTCKO (pin 34), WCKO (pin 35) and LRCK44 (pin 36) respectively.

When the sampling frequency is any frequency other than 44.1 kHz, TRD is L and OSEL is H and the PLL (IC308) goes to ON. The VCO output from IC308 is output from VCO (pin 4) and input to MCKI (pin 112) of IC307. The signals split into 294 divisions (Fs=48kHz) or 441 divisions (Fs=32 kHz) are output to COMPO (pin 3). The I3248 (pin 98) performs switching between the two frequencies via FS32 control signals (H when Fs=32 kHz) from the C-bit microcomputer. The signals obtained by splitting WCK8F are output from REFO (pin 2). The COMPO and REFO signals are input to COMPI (pin 3) and SIGI (pin 14) of IC308, and the phase comparison signal is output from PC20 (pin 13). This PC20 is input to VCOIN (pin 9) through a filter. As a result, the VCO oscillates with the 14.112 MHz locked to either 32 kHz or 48 kHz and is used by IC307 as the sampling rate conversion clock signal.

The data read out from L8FSI and R8FSI is used to perform the serial/parallel conversion with the shift register. It is converted into the Fs=44.1kHz data by performing calculations with the coefficient ROM data, and then output to XOUTCKO, WCK440, LRCK44 and DATAO which were created by the timing generation circuit. The output signals are then input to the jitter absorption buffer (IC315). The operation waveform of the PLL is shown in Fig. 5-35.

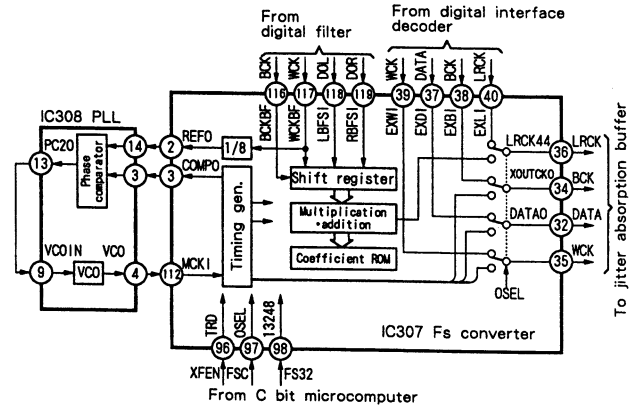

Fig. 5-34 Periphery block diagram of Fs converter

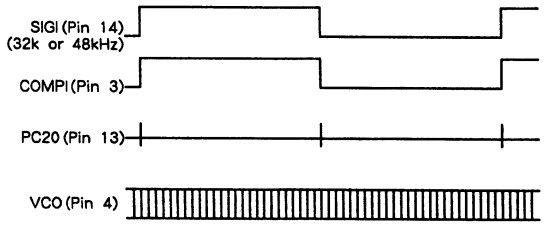

Fig. 5-35 PLL(IC308) operating waveform

5.5.4 Jitter absorption data buffer

In this IC, the digital interface decoder data and clock signals from the Fs converter as well as FS converted data and clock signals have jitter. As a result, another trigger is placed on the signals using jitter-free signals made by the VCO and clean clock signals and data are supplied to the other circuits.

The following is an explanation of this circuit based on Fig. 5-36. FS converter output is input to LRCK1 (pin 4), WDCKI (pin 3), BCK1 (pin 6), and DATAI (pin 9). The 16.9344 MHz output from VOUT (pin 8) of PCX1021 (IC316) of the VCO is input to VCOI (pin 20) of IC315. This output is divided to create LRCK and LRCK1 which are used in performing the phase comparison. If the difference in the phases of the two LRCK is 90- or more, the output will be distinguished as analog output and the mute function will be enabled. The phase comparison signal is output from PD (pin 18) through the IC317 filter, input to VIN (pin 1) of VCO, and the oscillation frequency is controlled.

Input from the Fs converter, that has had another trigger applied to it with a VCO clock signal, is output to LRCK2 (pin 28), WDCK2 (pin 27), BCK2 (pin 25) and DATAO (pin 1) and directed to the memory control IC (IC305).

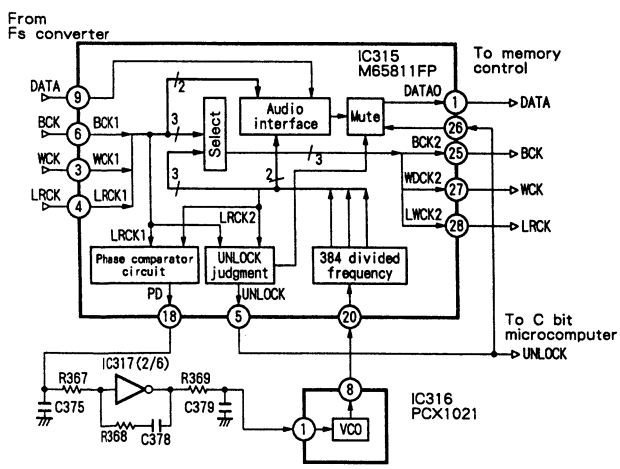

Fig. 5-36 Jitter absorption data buffer circuit

5.5.5 Memory controller

The memory controller (IC305: PD6107A), in addition to the functions mentioned in 5.5.1, has audio data, clock selector, digital mute and a function for recording audio data delay.

The following is an explanation based on Fig. 5-37. First, the data selected with the selector by combining XPB (pin 10) and XDIN (pin 11) received from the C-bit microcomputer is output to SDATA (pin 3), SBCK (pin 1), SWCK (pin 80) and SLRCK (pin 79).

In playback and stop modes, XPB goes to L and the signal from the CD decoder IC (IC225) input to PDATA (pin 69), PBCK (pin 70), PWCK (pin 71) and PLRCK (pin 72) is selected. When there is digital input in recording mode, XPB goes to H, XDIN goes to L, and the signal from the jitter absorption buffer input to DDATA (pin 74), DBCK (pin 75), DWCK (pin 76) and DLRCK (pin 77) is selected. When there is analog input in recording mode, both XPB and XDIN go to H and the AD converter signal input to ADATA (pin 64), ABCK (pin 65), AWCK (pin 66) and ALRCK (pin 67) is selected.

Each selected clock signal is input to the DA converter (IC), level meter interface (IC320), digital fader (IC309) and EFM encoder (IC311), and the data is input to the level meter interface and digital fader.

The digital fader output is input from FDATA (pin 6) again, passed through the mute circuit which activates with one word as distinction from the C-bit microcomputer, output to MDATA (pin 5), and finally directed to the DA converter.

The signals that pass through the mute circuit are sent to the memory control section in recording mode only.

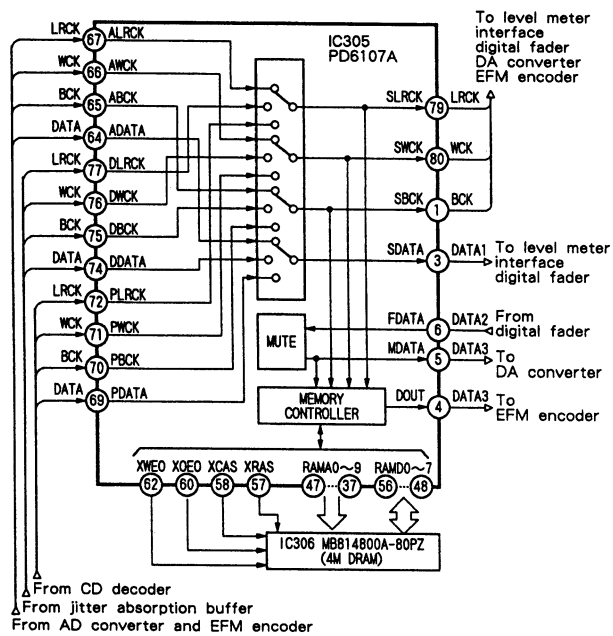

Fig. 5-37 Periphery block diagram of memory controller

The 16-bit data that is split into 8 bits, subjected to serial/parallel conversion every 8 bits, and sequentially written in the 4 Mbit DRAM. After about 3 seconds, the data is read, subjected to parallel/serial conversion, output to DOUT (pin 4), and directed to the EFM encoder.

5.5.6 Digital Fader and Level Meter Interface

The memory controller selector output is input to the digital fader (IC309: PD0026A). WCK, DATA and BCK are input to WCLK (pin 13), DATA (pin 14) and BCLK (pin 15) of IC309 respectively and the attenuation data is output to DOUT (pin 4).

The attenuation level is determined from the 8-bit data input to ADATA (pin 6) from the mode microcomputer (IC701: PD4468D) of the Function board assy.

The block diagram of the digital fader is shown in Fig. 5-38.

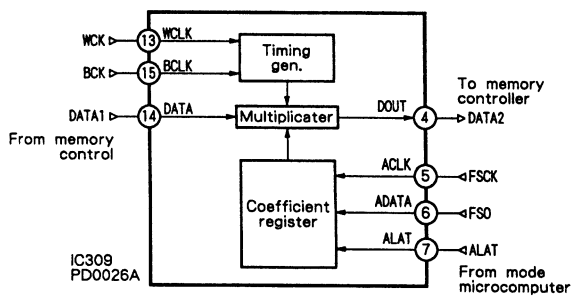

Fig. 5-38 Digital fader block diagram

The level meter interface (IC320: PD2020) output is identical to the memory controller selector output. It is input to LRCK (pin 34), WCK (pin 35), BCK (pin 36) and ADIN (pin 41). Absolute value and logarithmic conversions are performed on the data, which are read from SDATA (pin 15) as peak hold 8-bit data. The level meter on the front panel will then light.

This output is controlled from the mode microcomputer in the Function board assy through LR (pin 12), XRD (pin 13), FSCK (pin 14) and XSOE (pin 16). LR is the channel setting (Lch is H). XRD sends the peak hold data with L to the shift register of the CPU I/F and clears the peak hold as well. XSOE is H and SDATA is Hi-Z. When XSOE is L, the data is output following the XSCK serial clock signal.

The block diagram of the level meter interface is shown in Fig. 5-39.

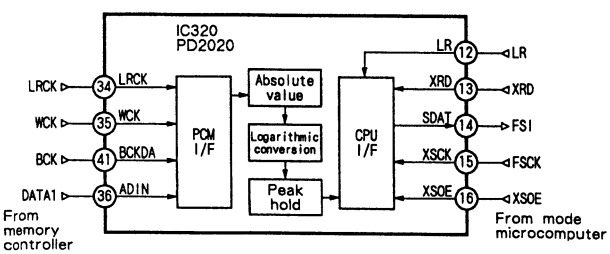

Fig. 5-39 Digital fader block diagram

5.5.7 EFM encoder

The block diagram of the EFM encoder (IC311: LC89583) is shown in Fig. 5-40. The clock and delayed data selected with the memory controller is input from DBC (pin 31), DLRC (pin 30) and DIN (pin 29) of the EFM encoder. This IC also has another audio interface. The LR clock signals are used with output as AD converter clock signals, however in recording mode the input is for the laser power calibration. By inputting the EFM output, calibration is performed using random data.

First, the input data passes through the MUTE circuit controlled from the mechanism-control microcomputer. For the output from the MUTE circuit, the interleave operation is performed in the CIRC (Cross Interleave Read - Solomon Code) encoder, C1 and C2 correction bits are added, and EFM modulation (Eight to Fourteen Modulation) is performed at the same time as the subcode, sync and merge bits are added. The output signals finally become CD format EFM signals after they have been subjected to NRZI conversion.

The signal on the disc is a signal from 3T to 11T (t=231 nsec). To create the ideal pit length in playback mode, slightly shorten the time that the LD (laser diode) is ON. More specifically, the 3T through 11T pulses go to N - 1T and are set to 2T to 10T. Only 2T is converted into a long 60 nsec pulse. These signals are output from EFM (pin 23) and proceed through the EFM control buffer (IC319: TC7S08F) via CN201. The signals then go through the LD drive circuit in the Head board assy and are input to the pickup of the LD where each signal is recorded.

There is a PLL that generates EFM system master clock (IC310: MC74HC4046AN) in the area of the EFM encoder. The 44.1 kHz divided from the master clock (16.9344 MHz) signals input from DCK (pin 32) of the EFM encoder, are output from PC1 (pin 95) and input to SIGI (pin 14) as the reference signals for the phase comparator of the PLL. The VCO output (pin 4) of the PLL is input to VCOIN (pin 96) of the EFM encoder and used as the EFM system master clock (8.6436 MHz).

The 196 - division clock signals are output from PC2 (pin 100), there phases compared with the phase of the above signals, and input from COMPI (pin 3) of the PLL as phase comparison signals. The phase comparator signals are output from PC20 (pin 13) and input to VCOIN (pin 9) as VCO control voltage. For SRAM (IC318: HM6264ALFP-12T) connected as the CIRC encoder, XMRD (pin 79) and XMWR (pin 80) are output as the control signals, and MAD0 (pin 65) through MAD11 (pin 76) are output as address signals. The data is input and output by MD0 (pin 81) through MD7 (pin 88).

An ATIP sync is input from the mechanism-control microcomputer to ATIPSYNC (pin 47) in order to synchronize the sub-code sync of the EFM signal to be recorded and ATIP sync on the disc. Sync operation is enabled when XEXTSYC (pin 49) goes to L.

Synchronization is performed in recording standby mode. The sub-code sync of the EFM signal is output from SUBSYNC (pin 2) for confirmation and read out into the mechanism-control microcomputer.

ENCE, MSCK and MSO are input from CE (pin 59), CL (pin 60) and DI (pin 61) respectively from the mechanism - control microcomputer as control signals. The control signals are effective when CE is H and DI data is read out at the CL rising edge. This is used for setting the operation mode of the EFM encoder and inputting subcode P and subcode Q.

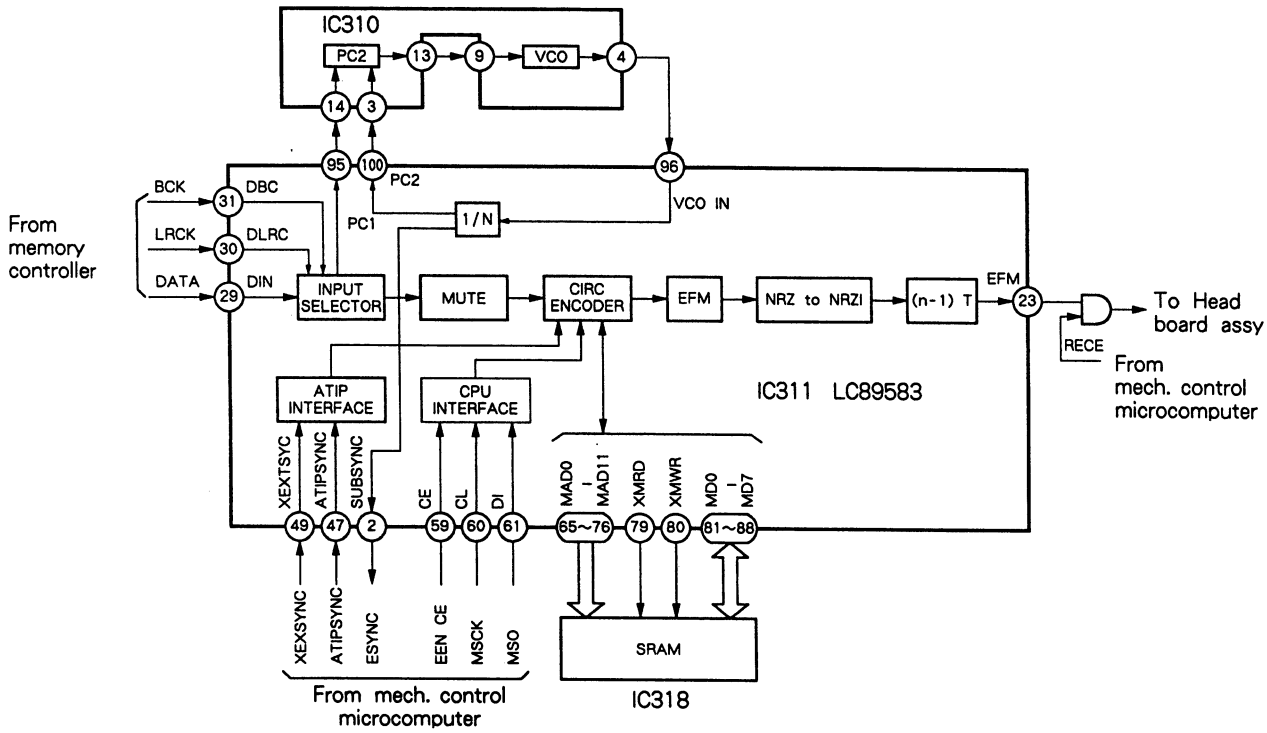

Fig. 5-40 Periphery block diagram of EFM encoder

5.5.8 Digital Audio Output

In the digital audio output, an analog input signal or signal encoded by the CD decoder (IC225: CXD2500BQ) and loop signal from the digital input or playback signal from the disc are subjected to AD conversion. The signals encoded by the digital interface encoder (IC321: TC923 1N) are selected by the selector (IC322: TC74HC153AP) and output from the coaxial (JA305) or optical (JA304 and JA311) output.

The DATA from the AD converter (IC804: CS5339) and LRCK and BCK made by the EFM encoder is input to the digital interface encoder. The C-bits are output with the category set to CD, the sampling frequency at 44.1 kHz, no emphasis, copy prohibited and the clock accuracy at ± 1000 ppm. The block diagram of the digital audio output is shown in Fig. 5-41.

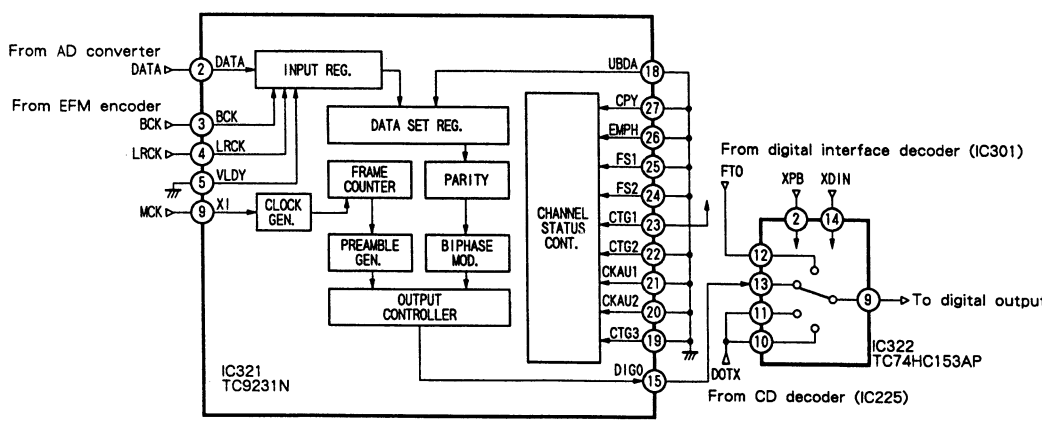

Fig. 5-41 Periphery block diagram of digital audio output

5.5.9 C - Bit Microcomputer

The C-bit microcomputer (IC304: PD4469A) controls the operation mode of the digital emphasis decoder, decodes the C and U-bits, performs transmission with the mode microcomputer, and converts serial commands from the mode microcomputer into parallel. Refer to the description on PD4469A in "7. IC Information" for further details about the output.

5.5.10 Master Clock System

The circuit diagram of the master clock system is shown in Fig. 5 - 42. In recording mode when the Fs is 48 kHz, the 384-times clock signal of the Fs is output with digital input from VCOO (pin 23) of the digital interface decoder. These clock signals are input to XTI (pin 6) as the master clock signals for the digital filter where 8-times WCK of the Fs is output to WCKO (pin 25). The 8 Fs clock signals are input to WCK8F (pin 117) of the Fs converter and 8 - division signals are output from REFO (pin 2) as PLL reference signals. They are then input to SIGI (pin 14) in the PLL and make a 294-times clock signal (14.112 MHz). This signal is output from VCO (pin 4), input from MCKI (pin 112) as the Fs converter master clock, and subjected to a sampling frequency conversion. At this time, the master clock signal from LRCK44 (pin 36) is split into 320 divisions and 44.1 kHz is output. It is then input to the jitter absorption buffer from LRCK1 (pin 4) as a reference clock signal. It consists of a VCO lithium rate and double PLL. This VCO oscillates on 384-times 16.9344 MHz of 44.1 kHz. The VCO clock signal serves as the master clock signal during digital output except for the clock input to pins 5, 6, 10 and 12 of IC 314.

When the Fs digital input is 32 kHz, the REFO output is 32 kHz. In this case, the divider in the Fs converter changes but the frequency of the Fs converter master clock does not change. Like before, 44.1 kHz is output from LRCK 44 and serves as the reference for the jitter absorption buffer.

In recording and playback modes during analog input, 16.9344 MHz of the crystal oscillator in the Audio board assy serves as the master clock signal of this system and is input to pin 3, 4, 11 and 13 of IC314. The oscillation of VCO of digital interface decoder and jitter absorption buffer are stopped at this time.

Two or more 16.9344 MHz master clock signals are matched to the operation mode and selected by IC314. The output from pin 7 by the master clock selected here is directed to the EFM encoder and CD decoder, and serves as the reference of the servo system. The output from pin 9 is directed to the digital interface encoder and DA converter in the Audio board assy to avoid control from the input select on the front panel when recording PMA and PCA.

In the Audio board assy, the selected master clock signal is also used via IC419 in order to improve the audio quality.

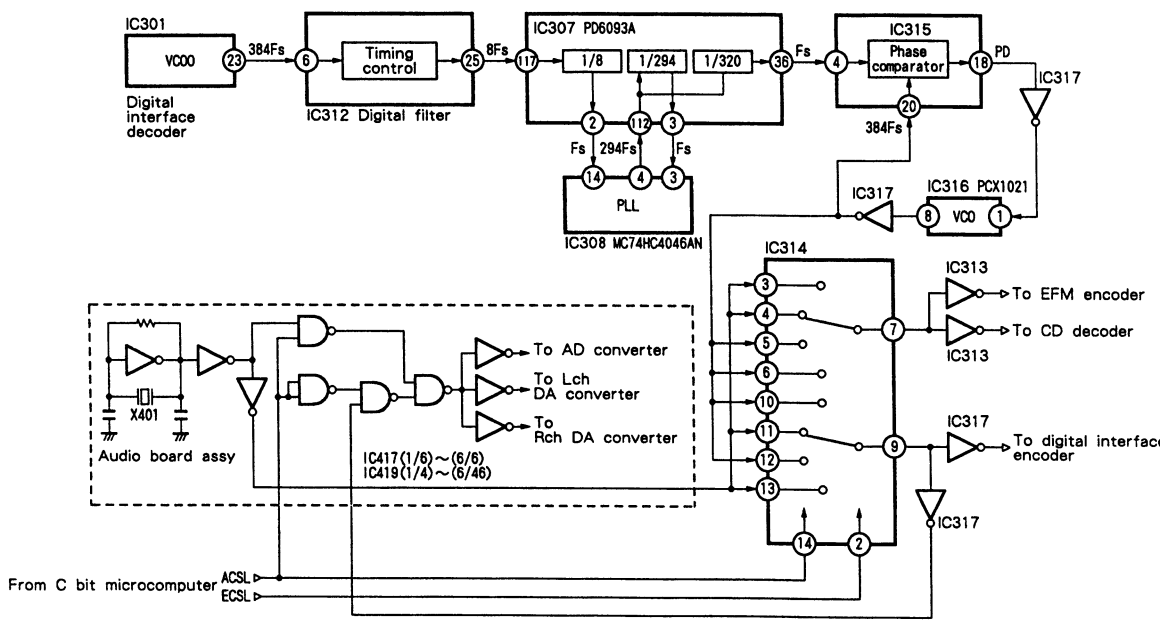

Fig. 5-42 Master clock circuit

6. ERROR DISPLAY AND TROUBLESHOOTING (MICROCOMPUTER)

6.1 ERROR CODES

When an error is detected, the corresponding code appears on the FL display of this unit. Operation will be stopped when it cannot be continued. Press the operation keys (including keys on the remote control unit) to clear the displayed error and return to the normal display.

Error codes are displayed with 7 segment digits on the FL display (TRACK to SEC) as follows.

When an error occurs

First, the error is displayed with Err xx and two digits in the minute display position. To provide for easy use, the errors are numbered and appear on the display as shown in Table 6 - 1. When these error codes are displayed, press the SKIP ON/OFF button to check the details of the errors for servicing. Each time you press the SKIP ON/OFF button, the display changes between the service error and user error display.

Table 6-1

Error No.	Error	Instructions
00	Hardware error HErr 00:00, 01:xx 02:xx, 03:xx Err xx:80, xx:81 xx:8F,	Turn the power off and on again. If the same error persists, contact service personnel.
01	Expired the battery HErr 00:BA	The life of the built-in lithium battery has expired. Contact service personnel to change the battery.
02	Mech. lock error Err xx:19	Internal mechanism does not work. Check the lock and spacer for transport.
03	Loading error Err 01:31, xx32 Clamp-up error Err xx:46	Error in loading section. Hold the tray by hand and check for loose or stuck parts.
04	Disc distinction error Err xx:20, xx:34 xx:82, xx:A4 xx:43, xx:86 xx:88	Error with set disc. The disc is inserted wrong-side up or the disc is dirty or scratched.
05	Recording error Err xx:37, xx:38 xx:83, xx:87 xx:88, xx:90 xx:A5	Recording is not possible. Check if the disc is dirty or scratched.
06	Recording stop error Err xx:84, xx:85 xx:A6	Recording stops due to scratches or sudden shock to the disc. Check if the disc is dirty or scratched. Do not shake the unit during recording.
07	TOC write error Err xx:39, xx:40 xx:A7	Error in TOC write. Some recorded discs cannot be played by CD player.
08	Disc open error Err xx:41, xx:A8	Information-write error on the disc when ejecting the disc. Press the OPEN/CLOSE button again. The tray will open without recording any information on the disc if 16 attempts are made without success. Check for dirtying or scratches on the disc.
09	Other errors	Check for dirtying or scratches on the disc. Contact service personnel if the same error still occurs.

The service-use error codes are as follows.

TRACK INDEX MIN SEC TRACK INDEX MIN SEC

E rr XX YY or HE rr XX YY

XX and YY indicate the mode when an error occurs and the error code using numbers 00 to 99.

6.2 EXPLANATION OF SERVICE ERRORS

6.2.1 Errors When Power is Turned ON

When you turn the power ON, the mechanism-control (UPD78323GJ-5BJ) and mode-control (PD4468D) microcomputers go to self-check mode. If an error is detected, the corresponding error code is displayed, and operation is stopped.

For errors which are detected when the power is turned ON, HE rr XX YY is displayed distinguishing from the error display during normal operation.

The following error explanation enumerates the possible damage.

XX = 00 : Errors detected by the mode-control microcomputer and can be classified into the following two types depending on the YY value.

YY = 00 : Error in transmission with the mechanism - control microcomputer.

If transmission with the mechanism-control microcomputer fails while the main routine is performed 256 times (about 8 seconds) after turning the power on, an error code is displayed and the operation is hung up.

The cause of this error is a defective connector, or insufficient power supply to the Servo•digital board assy.

YY = ba : Mechanism-control microcomputer check sum (battery) error

Occurs when damage to the backup RAM in the Servo • digital board assy is detected. When this error occurs, this unit will prohibits all recording.

This is because recording operation is protected against power outage by the backup RAM. An error occurs when this function does not function correctly.

The possible causes are that the life of the lithium battery in the Servo • digital board assy has expired, an inferior power system, or defects adjacent to the RAM section.

XX = 01 : Mechanism-control microcomputer PORT check error

When a self-check of the mechanism-control microcomputer is performed, the control pins are checked. If an error occurs, the pin number of the problem pin appears and the operation is hung up.

HE rr 01 ◯◯ → Pin no. of problem pin appears.

XX = 02 : Mechanism-control microcomputer ROM error

This error occurs and the operation is hung up if an error is detected in the area of the mechanism-control microcomputer expansion ROM.

The possible causes are defects in the ROM itself or in circuits adjacent to the ROM in the Servo•digital board assy.

XX = 03 : mechanism-control microcomputer RAM error

This error occurs and the operation is hung up if an error occurs in RAM write when self-checking the RAM of the Servo•digital board assembly.

The possible causes are defects in RAM itself or in circuits adjacent to the RAM in the Servo•digital board assy.

6.2.2 Errors During Normal Operation Part 1 (YY<80)

When an error occurs during normal operation, E rr XX YY appears and operations are stopped when they cannot continue.

The numbers for XX show the mode when the error occurs and that sent to the mechanism-control microcomputer from the mode-control microcomputer, as follows.

XX = ?0 : Unknown
- ?1 : OPEN
- ?2 : CLOSE/STOP
- ?3 : SET UP (disc loading)
- ?4 : TOC READ (including SET UP)
- ?5 : PLAY
- ?6 : SEARCH
- ?7 : REC/PAUSE
- ?8 : REC
- ?9 : END REC (lead-out recording during TOC WRITE)
- ?A : TOC REC (lead-in recording during TOC WRITE)
- ?B : PMA REC (temporary TOC information recording)
- ?C : OPC (power calibration)
- ?D : TOC CHECK (restoration of error disc)
- ?E : No function
- ?F : Recovery operation from power isolation

Note : ? represents a number from 0 to 9.

YY is a display of an error code detected by the mechanism-control microcomputer.

YY = 2 : STOP operation (cannot check if the spindle motor has stopped.)
- 4 : Focus operation (focus cannot be aligned)
- 5 : Spindle motor is not CAV locked.
- 6 : After tracking closes, a CAV lock cannot be checked within 10 seconds.
  - With CD : Subcode cannot be read within 10 seconds.
  - With CD - R : ATIP information cannot be read within 10 seconds.
- 7 : 1 track jump (outer direction)
- 8 : 1 track jump (inner direction)
- 15 : Track count search (outer direction)
  - 1 search is not finished within 3 seconds.
- 16 : Track count search (inner direction)
  - 1 search is not finished within 3 seconds.
- 17 : PAUSE
  - The current position is lost for 3 seconds or more during pause (ATIP/sub-code cannot be read.)
  - Synchronization of the encoder does not succeed for 3 seconds.
  - Does not return to original position after shock during play.
- 18 : PLAY ····· PLAY cannot continue.
- 19 : SEEK TRACK0
  - SSTOP signal is not generated within 3 seconds when the pickup returns to the original position.
  - TOCPOS signal is not generated within 300 ms.
- 20 : BLANK SEARCH
  - The current position is unclear for 3 seconds or more. (ATIP/sub-code cannot be read.)
- 21 : At the beginning of recording
  - Write-over is not possible due to a problem with the write-over position. (causing double write)

  During recording
  - Synchronization of the encoder is released for at least 1 second and there is no synchronization.
- 23 : ATIP search
- 24 : Sub-code search (TIME)
- 25 : Sub-code search (TNO)

  } Current position unclear for 3 seconds or more, jump error, or time-out for 3 minutes 30 seconds.
- 26 : N track jump (outer direction)
- 27 : N track jump (inner direction)
- 30 : TOC area search
  - Current position unclear or bad search
- 31 : Tray open operation
- 32 : Tray close, clamp or STOP operation

33 : Setup ····· Tracking not performed after checking the disc presence.
34 : Error during TOC read
35 : Error during PLAY
41 : PMA recording area does not exist (disc full).
42 : Tracking released at least three times or search failed during OPC operation.
43 : Error not detected after TOC check.
52 : Correct read of PMA information read cannot be done. (There is an RF but the sub-code cannot be read.)
54 : The information recording position search fails (recording area on CD - R will be searched).
55 : Repeated 1 track jump (outer direction) ·····1 track jump failed.
56 : Repeated 1 track jump (inner direction) ·····1 track jump failed.
58 : Tracking released during recording power sweep in OPC operation mode.
61 : Measurement of line velocity and tracking pitch failed.(search cannot be performed)
62 : 1 track jump (auto sequence: outer direction) failed.
63 : 1 track jump (auto sequence: inner direction) failed.
64 : 1 track jump repeated (auto sequence: outer direction) ·····1 track jump failed.
65 : 1 track jump repeated (auto sequence: inner direction) ·····1 track jump failed.
66 : 10 track jump (auto sequence: outer direction) failed.
67 : 10 track jump (auto sequence: inner direction) failed.
68 : 10 track jump (auto sequence: outer direction) failed.(during manual search.)
69 : 10 track jump (auto sequence: inner direction) failed.(during manual search.)
70 : 50 track jump (auto sequence: outer direction) failed.
71 : 50 track jump (auto sequence: inner direction) failed.
72 : 50 track jump (auto sequence: outer direction) failed.(during manual search.)
73: 50 track jump (auto sequence: inner direction) failed.(during manual search.)
74 : N track jump (auto sequence: outer direction) failed.
75 : N track jump (auto sequence: inner direction) failed.
76 : After a power outage, processing to maintain REC mode failed.
77 : Surface inspection failed.
78 : Blank (gap) search in the vicinity of the specified REC. area and specified starting address failed.
79 : Return operation for "needle jump" and "focus aberration" failed during REC.

Note : The numbers not defined above are not used or error codes that do not occur.

6.2.3 Errors during normal operation Part 2 (YY>80)

When an error occurs in normal operation mode, E rr XX YY appears on the display and the unit stops when operation cannot continue.
The error codes with a YY of 80 or higher do not have any special meaning with XX.

YY = 80 : Transmission error with mechanism-control microcomputer.
This error occurs if transmission with the mechanism-control microcomputer does not succeed in at least 8 seconds. This error occurs when the power is cut or when the power switch is hastily pressed (turned from ON to OFF to ON in a short period).

81 : DIO microcomputer (PD4469A) transmission error
This error occurs when transmission between the mode-control microcomputer and DIO microcomputer does not succeed for 4 seconds or more.

82 : This error occurs when there is a disc in the unit when the power is turned on, but the contents are not known.
This error mainly occurs in the program, meaning that it is unlikely that there is a problem in the hardware.

83 : This error occurs when an abnormality exists at the place of write on the disk in REC/PAUSE mode.
This error always occurs when the unit is operated in record protect mode.
Also, this error may occur if there is dust or scratches on the disc.
It also occurs due to a problem of the unit such as when the laser diode cannot obtain recording power or the RF detection circuit is inferior.

84 : Occurs when tracking is disengaged during recording.
The cause of this error is probably a dirty or scratched disc or shock to the unit.

85 : Occurs when synchronization of the sync is disengaged during recording.
There is a problem with the digital input signals or the disc is inferior. It also occurs due to a problem with the unit such as when the clock of each PLL circuit is disengaged.

86 : TOC READ error
TOC information (including temporary TOC) was not completely prepared during disc read.

87 : When start of recording was initiated, recording didn't start within 3 seconds.
This error occurs when the FS information is incorrectly used with professional-use equipment digitally connected.

88 : This error occurs when recording is attempted and there is a problem on a disc whose recording information is abnormal. Disc needs to check.

8F : Error indicated when the mode-control microcomputer runs wildly.

90 : This error occurs when input of the skip information is attempted on a disc on which recording is not possible (problem disc).

A4 to A8 : This error occurs when the aim operation is not finished within a certain time.

6.3 EXPLANATION AND ITEMS OF CAUTION OF NEW FUNCTIONS

6.3.1 Automatic REC/PAUSE

This function controls the start/stop of recording in synchronization with playback equipment when dubbing a CD. This function uses the sub-code that is sent on the digital interface of the playback equipment.

The subcode signal separated from the digital input signal is decoded by the DIO microcomputer. If there is normal input (playback equipment is playing or "the disc is spinning"), this unit starts recording operation.

The automatic REC/PAUSE function should be used with caution based on prudent operation following the directions in the operating instructions.

Also, you should note that there are some models even of the user-type which do not output subcodes.

6.3.2 Auto Track No. Increments

When there are subcodes just as with the aforementioned functions, the subcode signal is used and precise track detection is performed. Depending on the connected equipment, there will be normal no-audio status causing erroneous operation.

6.3.3 SKIP Function

The SKIP function is defined by the format (orange book) of the CD - R. The skip information recorded on the disc does not correspond with existing CD players.

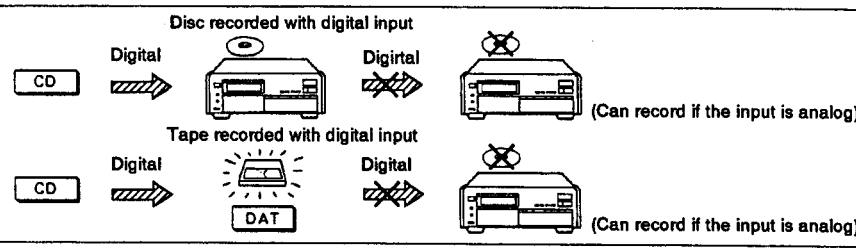
If TOC WRITE is performed using a recorder on a partial disc on which SKIP information has been recorded with this unit which does not correspond to SKIP, the SKIP information may be erased without registering this data.

6.3.4 SCMS Function

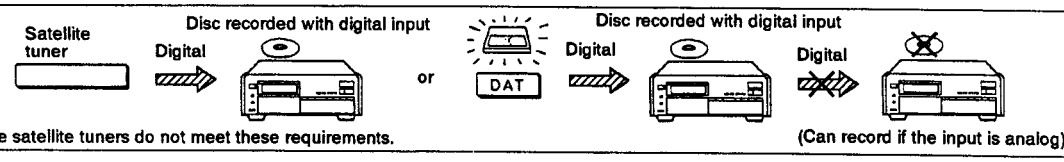
SCMS is an additional function to prohibit unregulated recording by adding information concerning copy prohibit to the digital signals. SCMS is the abbreviation for Serial Copy Management System.

This system was basically considered so that an original source (CD, etc.) can be digitally copied once. When the source is digitally copied, theoretically, there is not a loss in sound quality.

1 Copyrighted CD and DAT tapes can be digitally recorded only onto one machine.

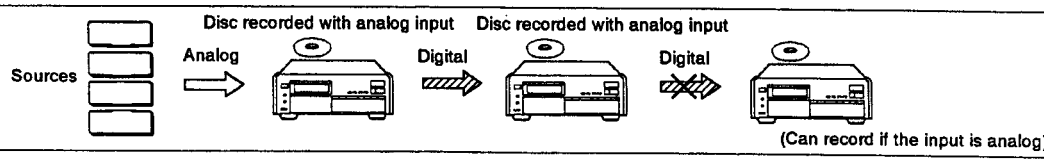


2 Digital signals from satellite broadcasts ca be digitally recorded only onto one machine.



• Some satellite tuners do not meet these requirements.

3 A disc recorded with analog input can record onto one machine regardless of the source to be recorded.



• Operation and display when recording

If it is determined through the SCMS function that recording is impossible during recording, the pause indicator flashes, the time display disappears, the COPY PROH indicator flashes and the recording operation will wait in a temporary pause mode. Once permission for recording is received, the COPY PROH indicator goes out and recording starts again.

It takes about 2 seconds for the unit to detect if recording is prohibited. It will look like the recording start/stop is delayed, however the record start/stop is being control in the correct changeover position using the digital delay memory function.

• SCMS Monitor Function

It is possible to monitor whether or not recording is possible in the recording standby state or in DA converter mode.

• COPY PROH indicator is lit : Recording is not possible.
• COPY PROH indicator is off : Recording is possible.

Cautions Before Recording

When the source equipment is CD, DAT, MD or DCC, the enabled/prohibit of the digital recording is unspecified until the start of the music. If the music source is started after this unit starts recording and the played song is found to be record-protected, this unit stops recording and may create unnecessary tracks. Recording must be started after confirming the enabled/prohibit state with the SCMS monitor function.

7. IC INFORMATION

- The information shown in the list is basic information and may not correspond exactly to that shown in the schematic diagrams.

■ PD4468D (IC701)
Mode control microcomputer

• Outline of Function

1. Function key input analysis
   Key matrix system by 8 outputs × 4 inputs (32 keys).
2. Remote control input analysis
   Double code which is conformed to standard.
3. FL display output
   Dynamic scan system.
   Improve the sound quality by display OFF.
   Control of LED driver IC.
4. Level detection and level meter display
   Communicate with level meter IC.
   Display the level meter.
   Display the peak margin.
5. Communicate with the mechanism control
   Read/transfer the mechanism operation, disc, disc inner time and skip informations.
6. Communicate with the C/U decode microcomputer
   Read the C bit, U bit and UNLOCK informations.
   Transfer the system control command.
   Realization of auto track number and auto record pause functions.
7. Digital attenuator IC control
   Realization of the fade function (Record/Playback).
8. Mechanism control function
   Record/Playback, Tuning operation, program playback, fade and skip etc.
9. Conform to SCMS (Serial Copy Management System).

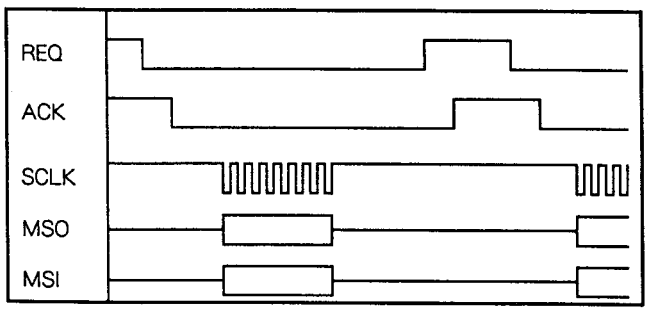
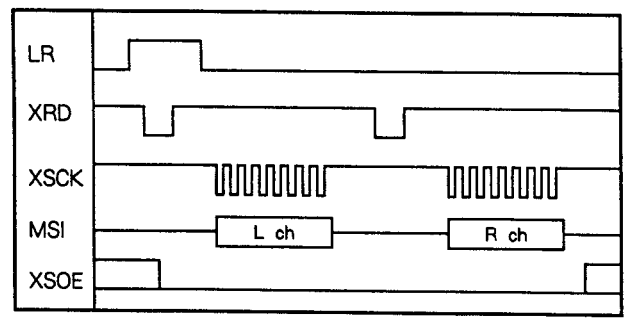
63	P52	DATA 2			
64	P53	DATA 3			

(Note 1)
Mechanism control microcomputer (hereafter referred to as the mechanism controller) communication pins (pins 31 to 34 and 42). Perform serial communication with the mechanism controller.
Communicates 12 bytes of data each time.



Communication is performed as follows.
① The mechanism controller sets the REQ (communication request) signal to L.
② This microcomputer sets the ACK (communication authorization) signal to L.
③ The mechanism controller serially transfers 1 byte of data and then sets the REQ signal to H.
④ This microcomputer sets the ACK signal to H when the serial transfer is successfully completed.
⑤ Steps ① through ④ are repeated until the transfer of 12 bytes of data is completed.
* The mechanism controller and this microcomputer observe the state of the control line from each other, and communication processing signals will be interrupted if the transfer conditions do not materialize within a certain time.

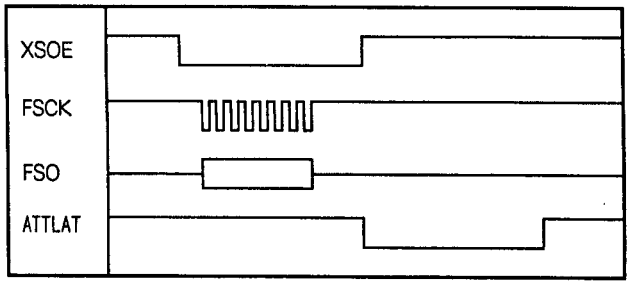
(Note 2)
Digital level meter communication pins (pins 39, 47 and 48). This microcomputer communicates with the digital level meter IC during a pause in communication with the mechanism controller, indicates the level on the FL display, and creates music-interval signals.



The communication format is as follows.
The channel for data readout is selected with LR signals. Select Lch with "H" and Rch with "L".
By setting the XRD signal to "L", the peak hold data is sent to the shift register for serial output of the microprocessor interface and the peak hold register is cleared at the same time.
Serial data is output with LSB first 8 bits. MSB serves as the overflow flag.
The data format obtainable through communication is shown below.

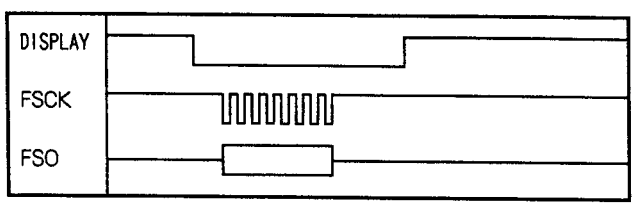
bit	7	6~0
	Overflow	90~24dB (1dB step)

(Note 3)
Digital attentuator IC (PD0026A) communication pin (pin 49).
Common with the key matrix output port and realizes the functions through key detection.
Communication transmits 1 byte of data one-way only from this microcomputer to the digital attentuator.
The communication format is as follows.



Communication is performed as follows.
① When this microcomputer detects a key input, it serially transfers the attentuator data when XSOE is L.
② When this microcomputer detects a key input, the data transferred in step ① above is latched when ATTLAT is L.
③ The data acquirable through communication are 177 steps of MAX 10110000 (ATT: 0 dB) to MIN 00000000 (ATT : -∞) with MSB first 1 byte binary.

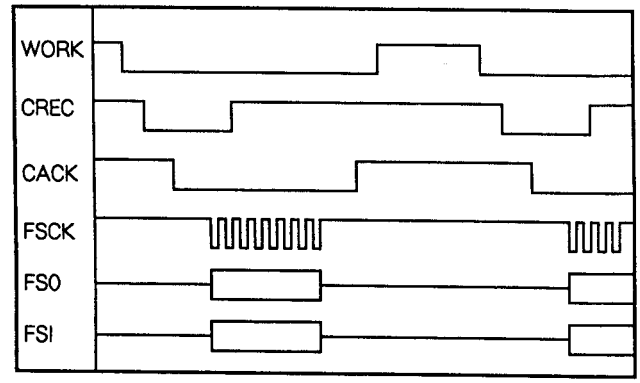
(Note 4)
LED driver IC (MB88306P) communication pin (pin 50).
Common with the key matrix output port and realizes the functions through key detection.
Communication transmits of MSB first 1 byte data one-way only from this microcomputer to the LED driver.
The communication format is as follows.



Communication is performed as follows.
① When this microcomputer detects a key input, it serially transmits the driver data when DISPLAY is L. The data is latched from the shift register.
② The communication data is configured as follows.

bit	7	6	5	4	3	2~0
	OPT1	OPT2	COAX	ANALOG	DISPOFF	REC LED

(Note 5)
C/U decoder microcomputer communication pins (pins 36, 40, and 43). This microcomputer communicates with the C/U decoder microcomputer.
The communication format is shown below.



Communication is performed as follows.
① Waits until the C/U decoder microcomputer finishes creating transmission data (WORK is L). (BUSY)
② This microcomputer sets the CREQ (communication request) signal to L.
③ The C/U decoder microcomputer sets the CACK (communication authorization) signal to L.
④ This microcomputer serially transfers 1 byte of serial data and sets the CREQ signal to H at the same time.
⑤ The C/U decoder microcomputer sets the CACK signal to H when the serial transfer is successfully completed.
⑥ Steps ② through ⑤ are repeated until the transfer of 12 bytes of data is completed.

* The C/U decoder and mode-control microcomputers interrupt communication processing if the transfer conditions do not materialize within a certain time.

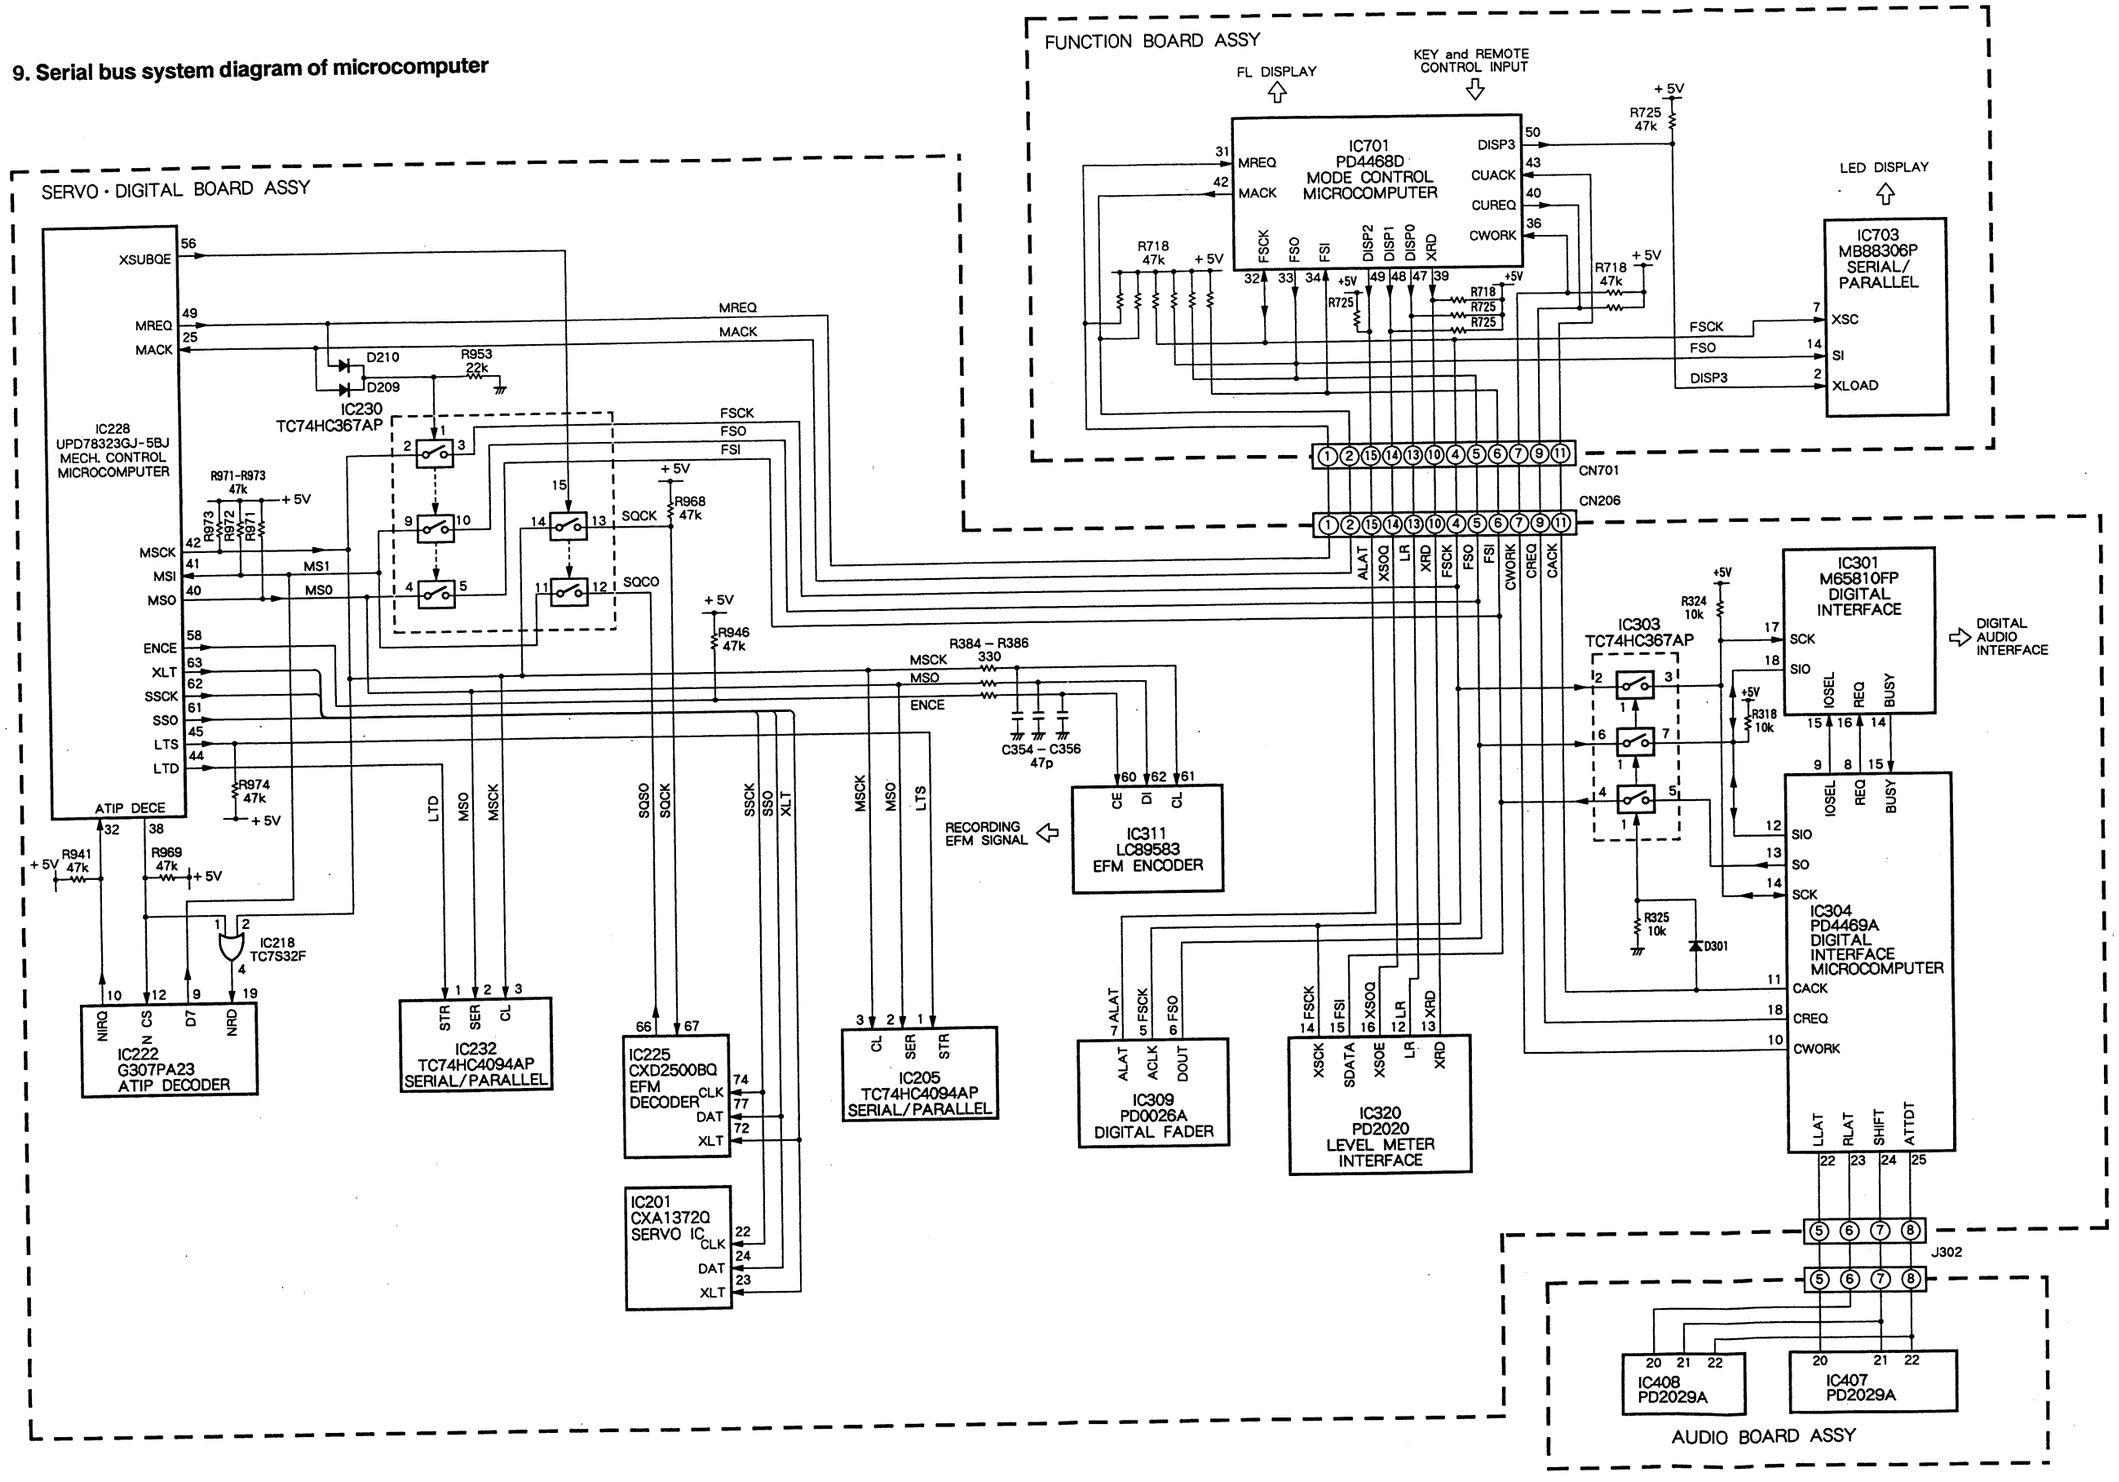
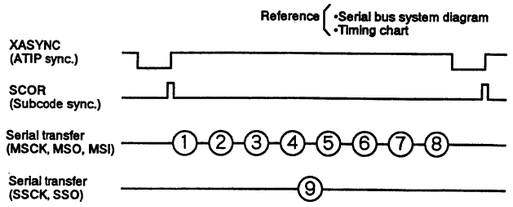
- With a CD-R
  The tracking error gain adjustment ends when the TEPP is greater than 2.38 V.

9. Serial bus system diagram of microcomputer



10. Outline of Serial Transfer Timing of the Mechanism Controller

The following serial transfer is performed with a standard cycle of 13.3 ms which has been synchronized to either ATIP sync signals (with CD - R) or playback subcode sync signals (with CD).
There are two serial bus systems.



① ATIP decoder communication format
Readout every 4 bytes (32-bit) of ATIP data from the G307PA23 ATIP decoder. The readout starts only when the ATIP decoder has decoded values (ATIP connector is L).

② Readout (reception) of playback subcode Q data
Readout the 10-byte subcode Q data of each subcode frame from the CXD2500BQ EFM decoder.
The readout is done only when CXD2500BQ has decoded values.

③ Expansion port output 1 in the Servo•digital board assy
Output 1 byte to IC205 (TC74HC4094AP) which has been latched to serial/parallel.

④ Transmitting and receiving data with the mode control CPU
Transmit and receive 12 bytes of data using a hand-shake line.

⑤ Mode setting output for the EFM encoder
Used to set the operation mode of the LC89583 EFM encoder. Transfer 8 bytes of data when the power is first turned on and 7 bytes thereafter.

⑥ Expansion port output 2 in the Servo•digital board assy
Output 1 byte of data to the IC232 (TC74HC4094AP) serial/parallel latch.

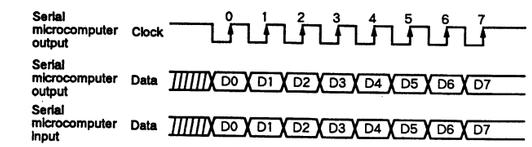
⑦ Output of recording subcode Q data
Sets the 10-byte subcode Q data and the 1-bit P data to be recorded in the next subcode frame for the LC89583 EFM encoder. Command transmissions of 1 byte accompany this setting both before and after for a total transfer of 12 bytes.

⑧ Test signal

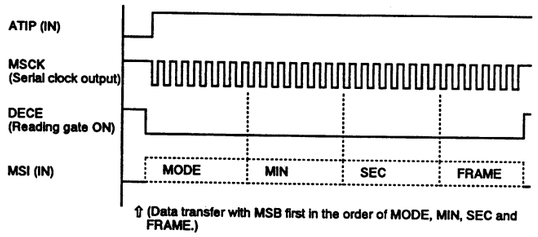
⑨ Servo system command setting output
Sets the operation mode for IC201 (CXA1372Q) and IC225 (CXD2500BQ). It occurs at the timing shown in the above figure, but serial transfer may occasionally occur to match the servo timing during search operation.

11. Serial Transfer Timings

Standard timing (all 8 - bit units)



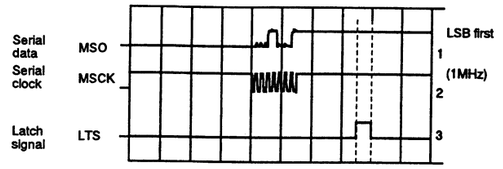
① ATIP data mechanism control serial input (MSCK serial clock : 1 MHz) (IC222 G307PA23)



② Readout timing of playback subcode Q data (IC225 CXD2500BQ)

	ADR	CONTROL
0	TNO lower	Upper
1	X lower	Upper
2	MIN lower	Upper
3	SEL lower	Upper
4	FRAME lower	Upper
5	ZERO lower	Upper
6	AMIN lower	Upper
7	ASEL lower	Upper
8	AFRAME lower	Upper

③ Output timing of the serial expansion port on the servo board (IC205 TC74HC4094AP)

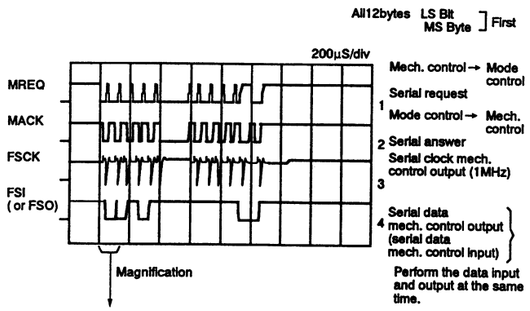


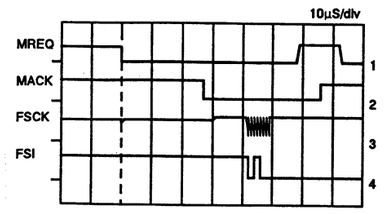
LSB first 8 bit

Bit	
0	TEG 0
1	TEG 1
2	TEG 2
3	SSEL
4	
5	CD MIR
6	XLDON
7	XAMUTE

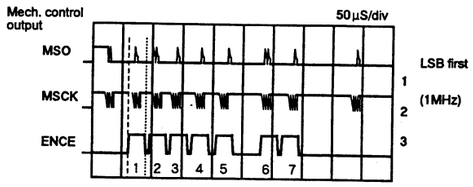
(Not used)

④ Serial data transfer to the mode-control CPU (IC701 PD4468D)



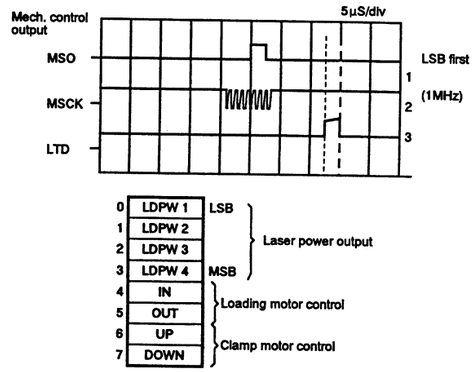


⑤ Mode (command) setting output timing to EFM encoder



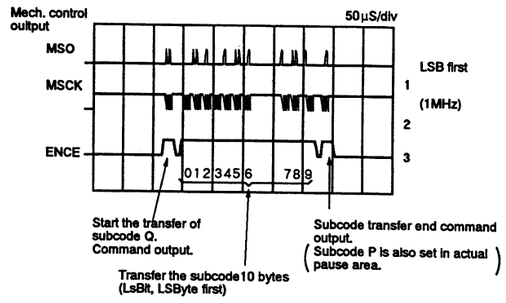
The EFM encoder commands consist of 8 different types (4-bit data each). Through serial transfer, the eight types of commands are set (refreshed) when the power is first turned ON, and the seven types during normal operation.

⑥ Output timing from the serial expansion port in Servo•digital board assy (IC232 TC74HC4094AP)



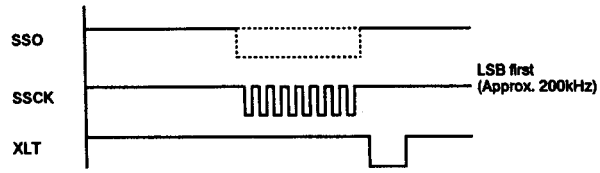
0	LDPW 1	LSB	Laser power output
1	LDPW 2		
2	LDPW 3		
3	LDPW 4	MSB	
4	IN		Loading motor control
5	OUT		
6	UP		Clamp motor control
7	DOWN		

⑦ Serial output of the recording subcode Q data to the EFM encoder (IC311 LC89583)

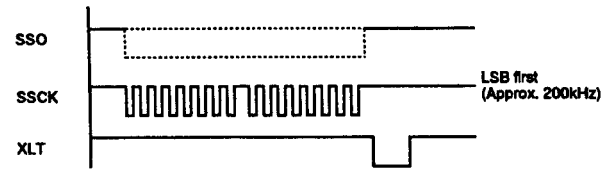


⑧ Servo system command setting serial output
(IC201 CXA1372Q, IC225 CXD2500BQ)

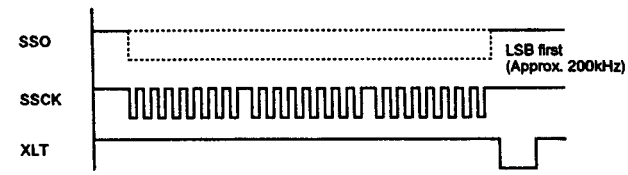
1) 8-bit command transfer



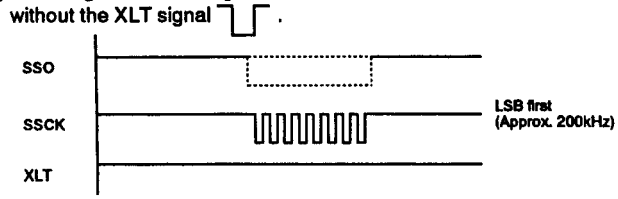
2) 16-bit command transfer



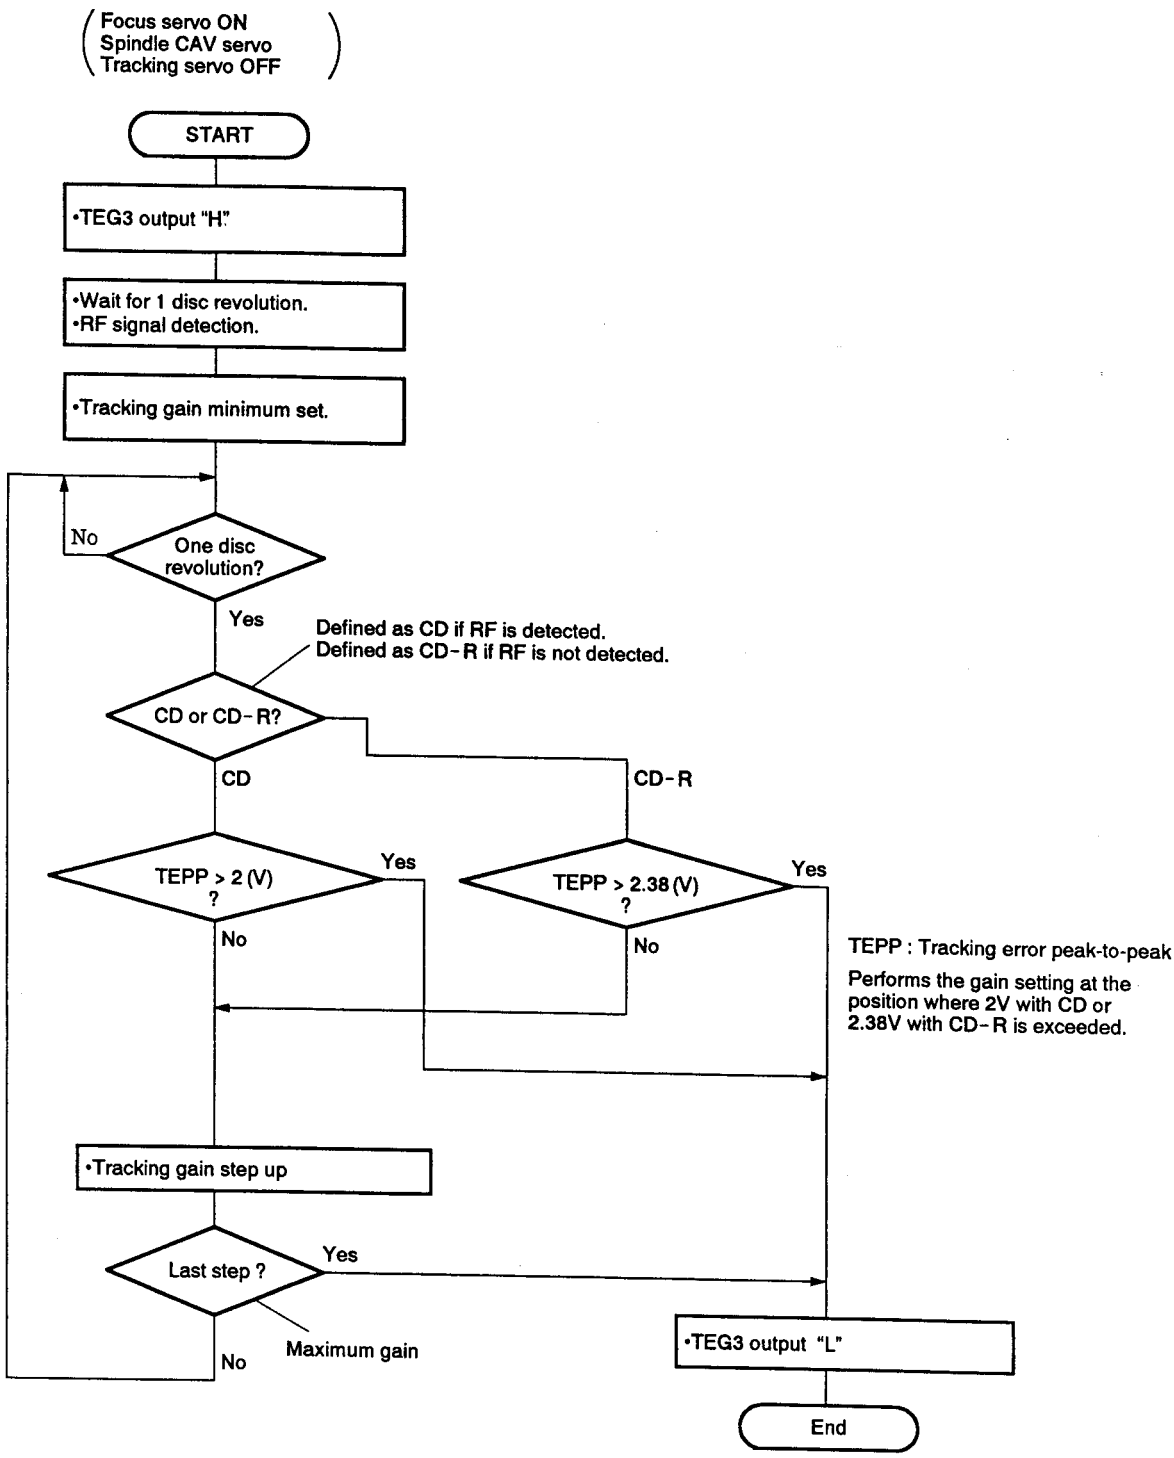
3) 24-bit command transfer



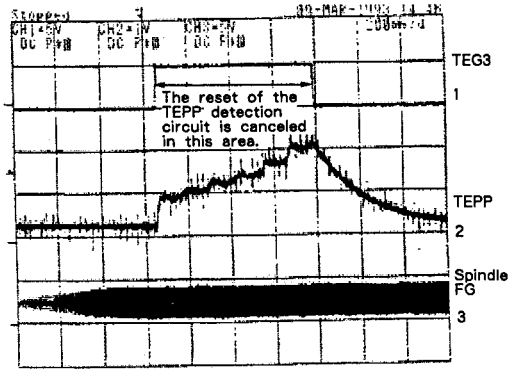
4) To change the SENS signal, the data transfer is also done without the XLT signal  .



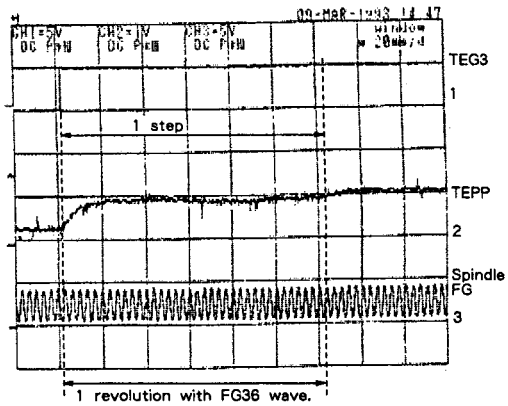
12. Tracking Gain Adjustment Operation Flow Chart



Status of tracking error peak-to-peak signal during tracking gain adjustment.



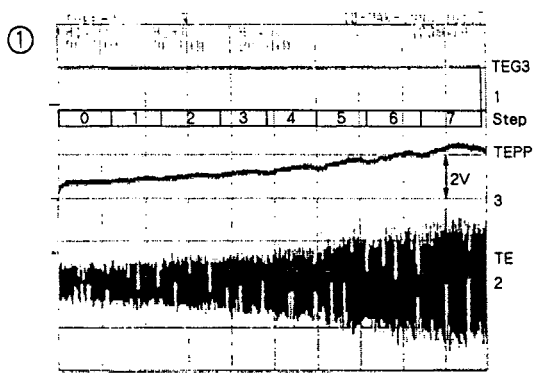
Enlarged diagram of 1 step.



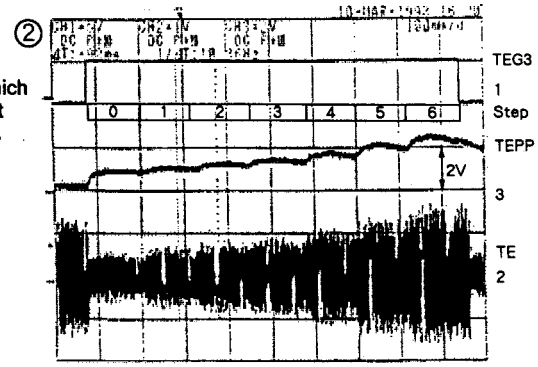
Timing chart of the tracking gain adjustment

The amplitude is set according to the steps where 2.0V TE peak-to-peak with CD or 2.38V TE peak-to-peak with CD - R is exceeded.

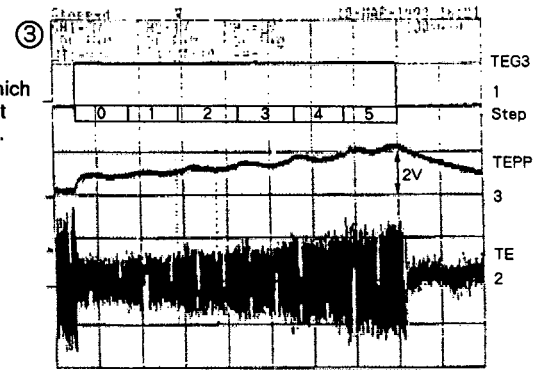
① Example in which the disc gain is small and raised to the maximum.
The specified gain is exceeded in step 7.



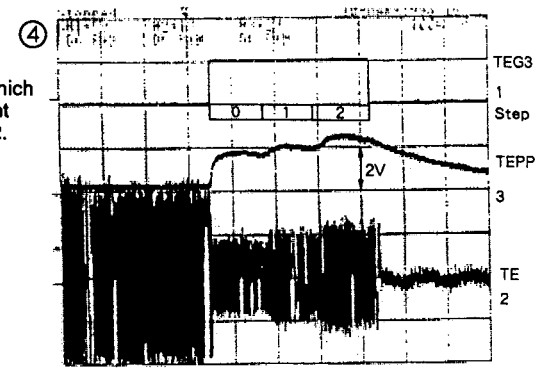
② Example in which the adjustment ends in step 6.



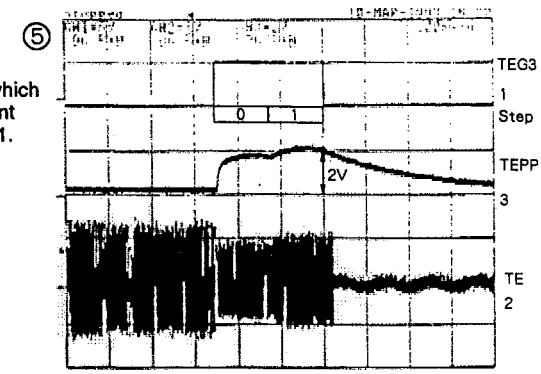
③ Example in which the adjustment ends in step 5.



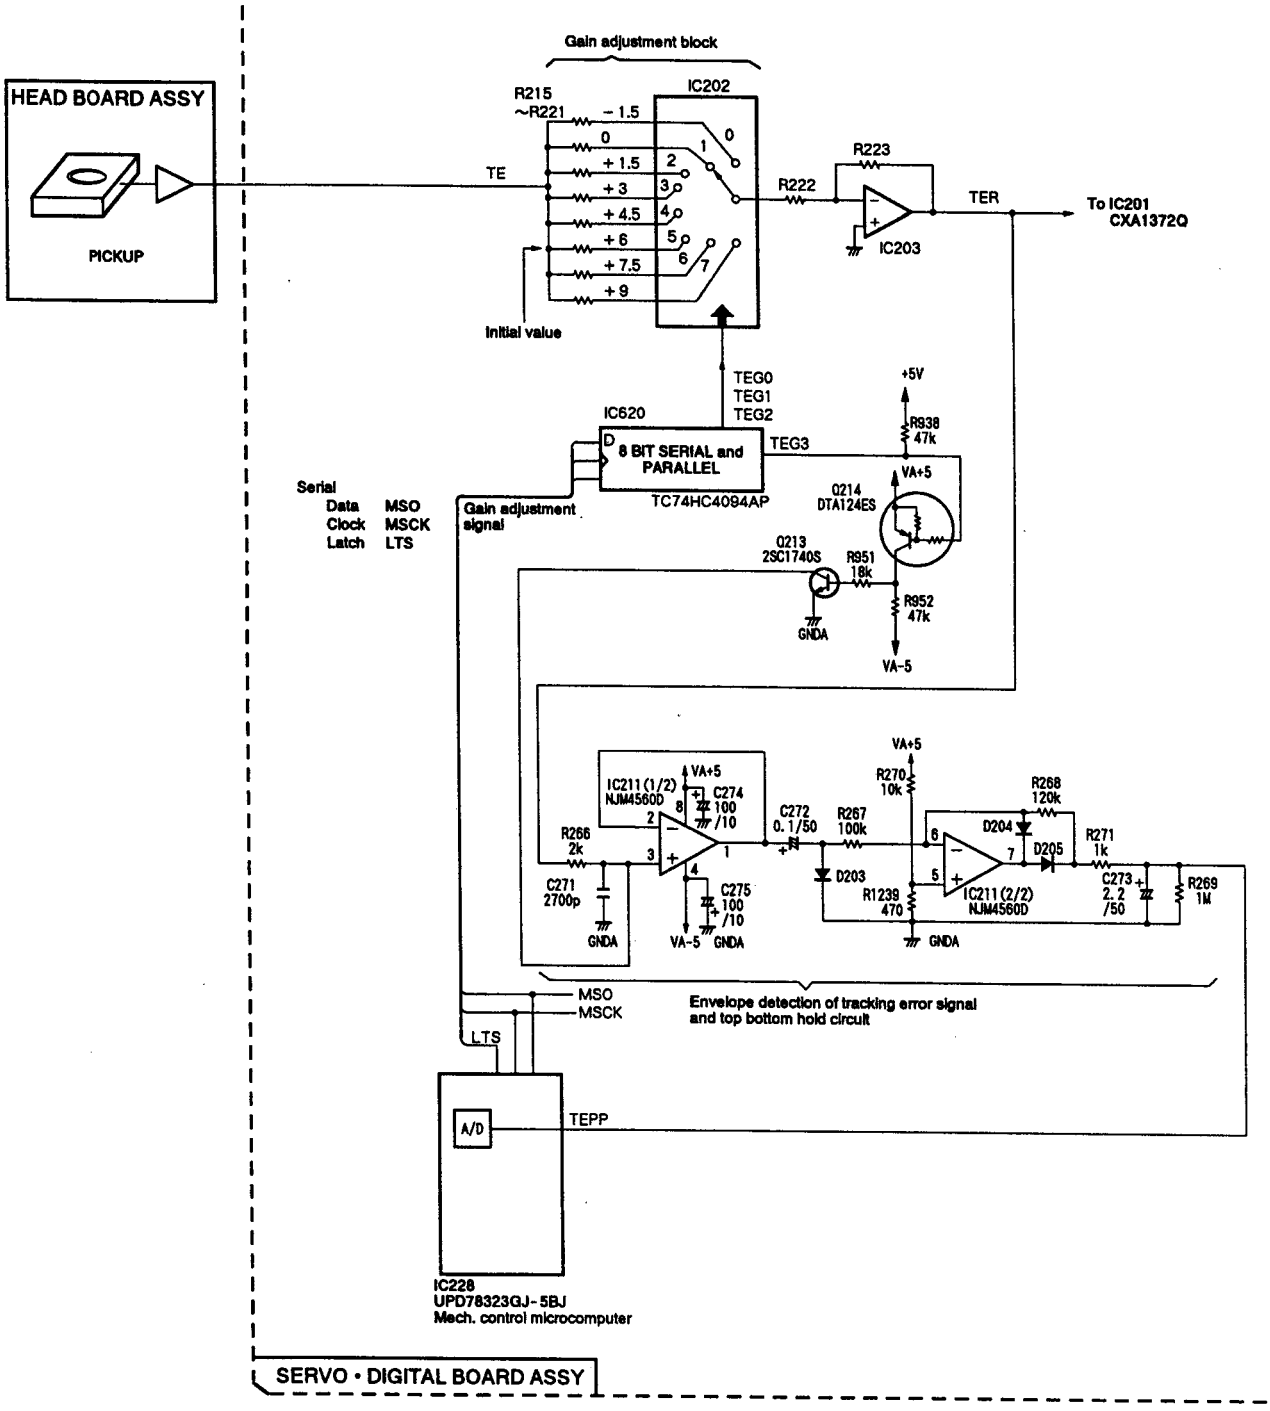
④ Example in which the adjustment ends in step 2.



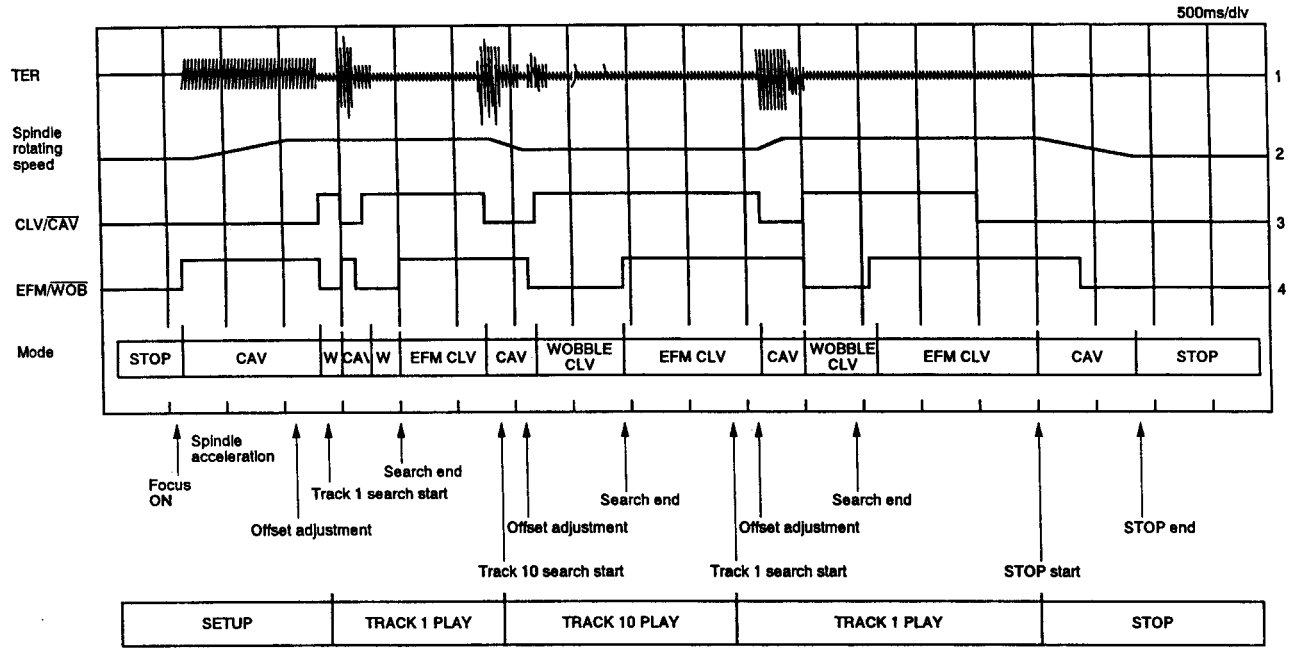
⑤ Example in which the adjustment ends in step 1.



13. Circuit Diagram of Tracking Gain Adjustment

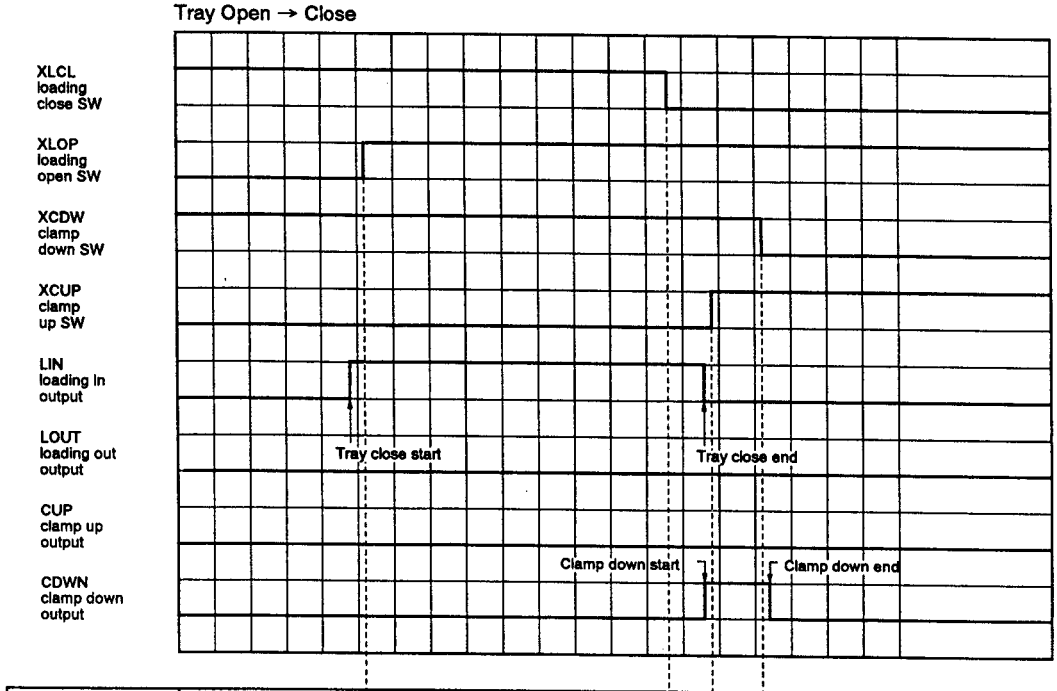


14. Spindle Servo Mode Switch in CD-R STOP → PLAY → SEARCH → STOP Operation



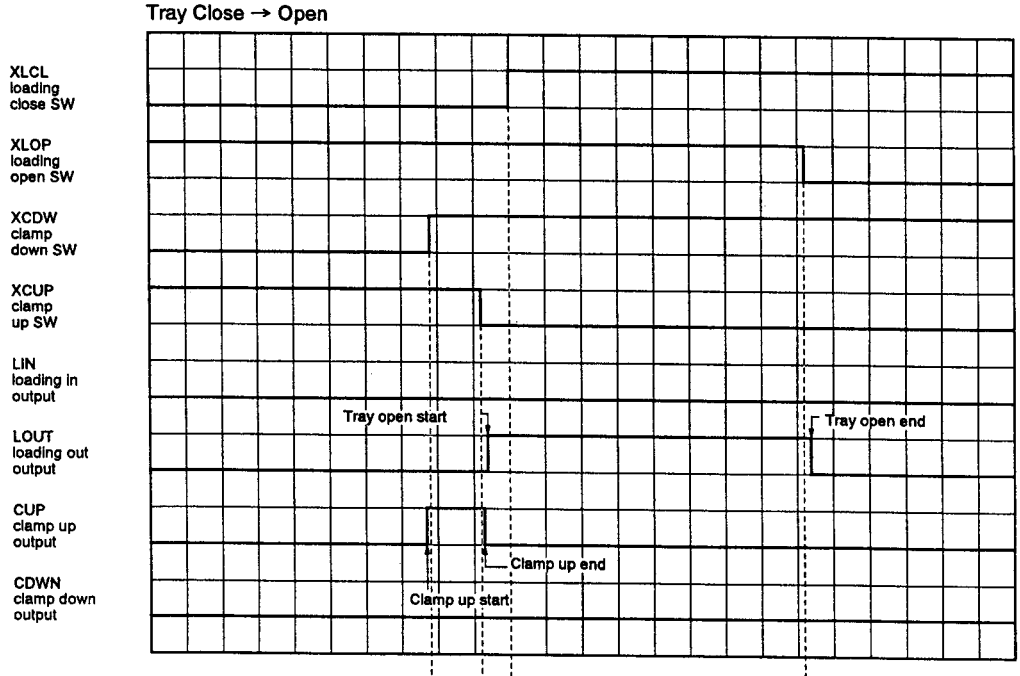
15. Open • Close Operation Timing Chart

Tray Open → Close



Loading state	Open end	During close	Close end
Clamp state	Up end	During down	Down end

Tray Close → Open



Loading state	Close end	During open	Open end
Clamp state	Down end	During up	Up end

- Clamp standby state

The slider is locked so that it cannot move during shipping. When a disc is not mounted, the tray is set to this position.

Points: ① It is possible to move the slider only when the tray is in the clamped state. To open the tray, first move the slider to the TOC position.

② When the tray is in the clamped state, set the clamp down before performing the setup.

• Description of functions and operation format

• Communication with mode controller
Communication conditions
CWORK is H when creating C-bit and U-bit data, and L at all other times. The L section is 13.3 mS to 62.4 mS. In this section, serial communication is performed if there is a /CREQ signal from the mode controller. Request signals are not accepted in the H section.

• CREQ, CACK, SI, SO, SCK and CWORK
This microcomputer performs handshake with the mode controller as follows.

1. The mode controller sets the /CREQ signal to L.
2. This microcomputer sets the CACK (communication approval) signal to L.
3. After the mode controller sets the /CREQ signal to H, 1 byte of serial data is transferred. (512 kHz transfer clock)
4. This microcomputer sets the CACK signal to H when communication succeeds.
5. Steps 1 through 4 are repeated until the transfer of 12 bytes of data is completed.

5	D4	ON4T	Data bus bit 4				
6	VSS	—	Ground				
7	D5	ON4T	Data bus bit 5	23	VSS	—	Ground.
8	D6	ON4T	Data bus bit 6	24	MCSEL	ICN	Motor control selection (Input). When MCSEL = 0, internal motor control is ERRPWM. When MCSEL = 1, external (MSC pin 25) is ERRPWM.
9	D7	ON4T	Data bus bit 7 or serial output.				
10	NIRQ	ON40D	Interrupt request output. (Active : L)				
11	VCC	—	Power supply voltage. (5V ± 10%)				
12	NCS	ICN	Output enable for D0 − D7. (Active : L)	25	MSC	ISN	External motor speed control (Input).
13 | 17	NC	—	Not used.	26	ERRPWM	ON40D	Motor control output (open-dorein).
18	SEPPAR	ICN	μ C interface selection. When SEPPAR=0, select parallel μ C interface. When SEPPAR=1, select serial μ C interface.	27	SCN	ICN	Scan pass enable (Active : L). Scan pass is used only while this IC is produced. Generally, SCN is active High.
19	NRD	ICN	Reading control input. (Active : L)	28	VCC	—	Power supply voltage. (5V ± 10%)

Note; ISNH =CMOS non-inverting schmitt trigger input clock driver.
ISN =CMOS non-inverting schmitt trigger input.
ON40D =Open-dorein output 4mA (current decrease).
ON4T =3 states output 4mA (current decrease).

• Pin Functions

No.	Name	I/O	Function	No.	Name	I/O	Function
1	P/S	I	Serial and parallel controls switch.	19	MCK	O	System clock output.
2	RZ	O	R ch digital zero detection output.	20	LATCH (EMI)	I	Data latch signal input pin for attenuator when controlling with serial. Deemphasis filter mode selection pin when controlling with parallel.
3	TEST	I	Test pin. Normally, used to "H".				
4	VDA	—	Analog power supply voltage for R ch DA converter.				
5	RO	O	R ch data positive output.	21	SHIFT (EM2)	I	Shift clock input pin for attenuator when controlling with serial. Deemphasis filter mode selection pin when controlling with parallel.
6	RO	O	R ch data negative output.				
7	GNDA	—	Analog ground for R ch DA converter.				
8	GNDA	—	Analog ground for L ch DA converter.	22	ATT (MUTE)	I	Data input pin for attenuator when controlling with serial. Muting pin when controlling with parallel. "H" at mute on.
9	LO	O	L ch data negative output.				
10	LO	O	L ch data positive output.				
11	VDA	—	Analog power supply voltage for L ch DA converter.	23	OSCE	I	System clock control. "L" at system clock is stopped .
12	GNDX	—	Ground of oscillation block.	24	RESET	I	Reset pin. Reset the Σ Δ circuit and attenuator data set to 00 (HEX) for "L".
13	XI	I	Connect the crystal. Generate the needful clock for system.				
14	XO	O					
15	VDX	—	Power supply voltage of oscillation block.	25	DATA	I	Data input.
16	GND	—	Ground of logic block.	26	BCK	I	Bit clock input.
17	C	I	Clock selection. "L" is correspond to 256fs and "H" is correspond to 384fs.	27	LRCK	I	LR clock input. ("H" : L ch data)
18	LZ	O	L ch digital zero detection output.	28	VDD	—	Power supply voltage of logic block.

■ CS5339 (IC804)
16 Bit ΔΣ System 2ch A/D Converter

• Pin Functions

No.	Name	I/O	Function
1	AGND	–	Analog ground pin.
2	AINL	I	L ch analog input pin. Connect a capacitor (10nF) between this pin and AGND pin.
3	ZEROL	I	L ch zero level input pin. Normally, the Lch offset is calibrated using the input voltage of this pin as the zero level. Connect to AGND pin.
4	VA+	–	Analog positive power supply voltage pin, +5V.
5	VA –	–	Analog negative power supply voltage pin, – 5V.
6	APD	I	Power down pin of analog block. Power down mode for "H".
7	ACAL	I	Analog calibration pin. Normally, connect to DCAL pin. Switch the input pin of external signal by this pin's level. "H" : Zero level input pin (ZEROL, ZEROR) "L" : Analog input pin (AINL, AINR)
8	NC	–	No connection. Use for open.
9	DCAL	O	Digital calibration pin. Indicates that offset calibration is in progress. Normally, connect to the ACAL pin. Falls down immediately when a power down signal is input to the DPD pin. DCAL is set to L after a 4096 L/$\overline{R}$ cycle (about 85 ms when fs=48 kHz) from fall down of the DPD pin and indicates the end of calibration.
10	DPD	I	Power down pin of digital block. Goes to power down mode when this pin is H. Offset calibration starts at the falling edge. Always perform calibration after turning the power on or changing the clock frequency.
11	TST	I	Test pin. Connect to DGND pin.
12	CMODE	I	Master clock selection pin. "L" : CLK=256fs (12.288MHz fs=48kHz) "H" : CLK=384fs (18.432MHz fs=48kHz)
13	SMODE	I	Interface clock selection pin. Set the input and output of the L/$\overline{R}$, SCLK and FSYNC clock pins. L : Slave mode (all pins are input pins) H : Master mode (all pins are output pins)
14	L/$\overline{R}$	I/O	Input channel selection pin. Slave mode: Inputs fs clock signals. Outputs the Lch and MSB data at the rising edge and the MSB data of the Rch at the falling edge. Master mode: Outputs fs clock signals. Outputs SDATA after ISCLK at the L/$\overline{R}$ edge. This pin is H during power down (DPD=H).
15	SCLK	I/O	Serial data clock pin. Outputs 1-bit data at the falling down of this pin. Slave mode : Inputs clock signals of 32fs to 64fs. Master mode : Outputs clock signals of 64fs. This pin is L during power down (DPD=H).
16	SDATA	O	Serial data output pin. The data is output from MSB in order in 2s complementary form. After 16-bit output, the 3-bit over/under scale flag and L/R flag are output. This is L during power down (DPD=H).
17	FSYNC	I/O	Frame sync. clock pin. Slave mode : When FSYNC is H, SDATA output is enabled. Master mode : Outputs 2fs clock signals. When 16-bit data is being output, FSYNC is H. This can be used for data latch. FSYNC is L during power down (DPD=H).
18	VD+	–	Digital power supply voltage, +5V.
19	DGND	–	Digital ground pin.
20	CLK	I	Master clock input pin. CMODE = "H" : 384fs, CMODE = "L" : 256fs
21	OCLK	O	128fs clock output pin. Toggles at the rising of the master clock (CLK). OCLK is L during power down (DPD=H).
22	NC	–	No connection. Use for open.
23	ICLK	I	128fs clock input pin. Clock signal for the analog section. Connect to pin OCLK. The sampling rate of the Δ Σ modulator is 64 fs.
24	LGND	–	Logic ground pin of analog block.
25	VL+	–	Logic power supply voltage pin of analog block, +5V
26	ZEROR	I	R ch zero input pin. Normally, the Rch offset is calibrated using the input voltage of this pin as the zero level. Connect to pin AGND.
27	AINR	I	R ch analog input pin. Connect to the 10 nF condenser between this pin and pin AGND.
28	VREF	O	Reference voltage output pin, – 3.68V. The full-scale of the input signals depends on the voltage here. FS= ± 3.68 V when VREF=-3.68 V Connect the 6.8 μF electrolytic condensor and 0.1 μF ceramic condensor between this pin and AGND in parallel.

• Pin Functions

No.	Name	I/O	Function
1	SBCK	O	Bit clock output which was selected by input selector.
2	Vss	–	Connect to ground.
3	SDATA	O	Data output which was selected by input selector.
4	DOUT	O	Data output which was delayed by external RAM.
5	MDATA	O	Data output which was through the digital mute.
6	FDATA	O	Data input to digital mute.
7	EDATA	O	Data input to external RAM. Select MDSEL with H.
8	XVCO	O	Output from command register set to QA. Can be used as an general-purpose register.
9	XMUTE	O	Output from command register set to QB. Sets digital mute to ON with L. Normalized at the falling of SWCK.
10	XPB	O	Output from command register set to QC. Selects PLRCK, PWCK, PBCK and PDATA of the input selector with L.
11	XDIN	O	Output from command register set to QD. Effective when XPB is H. Selects DLRCK, DWCK, DBCK or DDATA of the input selector with L, and ALRCK, AWCK, ABCK or ADATA of the input selector with H.
12	Vss	–	Connect to ground.
13	MDSEL	I	Input to select data to be written in external RAM. Selects FDATA passing digital mute with L and EDATA with H.
14	MEMC	O	Output from command register set to QE. Reset signal for the memory controller. Reset with L. The two samplings (8 words) directly after reset are not written in the memory.
15	X64	O	Output from command register set to QF. Select the clock signals for the memory controller. 64 fs at L and 32 fs at H. To be matched to SBCK.
16	XMMUTE	O	Output from command register set to QG. Mute signal of data to be written in memory. Mute ON at L. Normalized at the rising of SLRCK.
17	DELAY	O	Output from command register set to QH. Memory-through control signal. Data passing through the memory is output from DOUT at L (data selected with MDSEL), and data delayed by the memory at H.
18	ULAT	O	Output obtained through 8-division of WCLK at the falling. U-bit data is output to QA through QH at each rising.
19	QH	I/O	MSB (before input) output from U-bit register and data input to command register.
20	QG	I/O	U bit register output and data input to command register.
21	QF		
22	QE		
23	Vss	–	Connect to ground.
24	QD	I/O	U bit register output and data input to command register.
25	QC		
26	QB		
27	QA	I/O	LSB (after input) output from U-bit register and data input to command register.
28	MLAT	I	Input of clock signals for the command register to read. Data set in QA through QH is read at the rising of this signal and output to XVCO, XMUTE, XPB, XDIN, MEMC, X64, XMMUTE and DELAY.
29	USEL	I	Input of QA through QH two-way bus input/output changeover. L : output , H : input
30	UBIT	I	U bit data input. Must be changed with the falling edge of WCLK.
31	WCLK	I	U bit shift clock input .
32	X4M	I	Selection input of memory capacity. L : 4M bits, H : 8M bits.
33	V_{DD}	–	Connect to +5V.
34	XRESET	I	Reset input. Reset for L.
35	TEST	I	Test mode input. Normally, active L.
36	N.C.	–	No connection.
37	RAMA9	O	Address outputs to external RAM.
38	RAMA8		
39	RAMA7		
40	RAMA6		
41	RAMA5		

No.	Name	I/O	Function
42	Vss	–	Connect to ground.
43	RAMA4	O	Address outputs of external RAM.
44	RAMA3		
45	RAMA2		
46	RAMA1		
47	RAMA0		
48	RAMD7	I/O	Data inputs and outputs of external RAM.
49	RAMD6		
50	RAMD5		
51	RAMD4		
52	Vss	–	Connect to ground.
53	RAMD3	I/O	Data inputs and outputs of external RAM.
54	RAMD2		
55	RAMD1		
56	RAMD0		
57	XRAS	O	Low address select output of external RAM.
58	XCAS	O	Column address select output of external RAM.
59	XOE1	O	Output enable output of external RAM. Connect to another external RAM during 8M bit output.
60	XOE0	O	Output enable output of external RAM.
61	XWE1	O	Write enable output of external RAM. Connect to another external RAM during 8M bit output.
62	XWE0	O	Write enable output of external RAM.
63	Vss	–	Connect to ground.
64	ADATA	I	Data input of input selector.
65	ABCK	I	Bit clock input of input selector.
66	AWCK	I	Word clock input of input selector.
67	ALRCK	I	LR clock input of input selector.
68	STBY	O	Standby output of AD converter. Standby mode with H and operation mode with L. Set to L when both XPB and XDIN are H and normalized at the rising of ALRCK.
69	PDATA	I	Data input of input selector.
70	PBCK	I	Bit clock input of input selector.
71	PWCK	I	Word clock input of input selector.
72	PLRCK	I	LR clock input of input selector.
73	V_{DD}	–	Connect to +5V.
74	DDATA	I	Data input of input selector.
75	DBCK	I	Bit clock input of input selector.
76	DWCK	I	Word clock input of input selector.
77	DLRCK	I	LR clock input of input selector.
78	LRCKINV	I	Polarity inverse input of DLRCK. Inverse with L and through with H.
79	SLRCK	O	Output of LR clock selected by input selector.
80	SWCK	O	Output of word clock selected by input selector.

• Block Diagram

• Pin Functions

No.	Name	I/O	Function
1	DATAO	O	Data output. When pin 24 is H, first system data will out. When pin 24 is L, second system data will out.
2	64/32FSCN	I	Bit clock 64/32 fs switch. Control the data rate of data output. . (L : 64 fs, H : 32 fs)
3	WDCK1	I	First system word clock input. Input 2 fs which generating at first PLL. If its not used, fix to L or H.
4	LRCK1	I	First system LR clock input. Input 1 fs which generating at first PLL. This signal is certain to input.
5	UNLOCK	O	Unlock. H is output when a mismatch in synchronizing the 1st PLL system clock and 2nd PLL system clock occurs.
6	BCK1	I	First system bit clock input. Input 64 fs which generating at first PLL. This signal is certain to input.
7	V_{DD}	–	Power supply voltage 1 for internal logic and I/O.
8	ALCR	I	Reset. Reset signal input. (L : reset)
9	DATAI	I	Data input. Input data with MSB first synchronizing with 64 fs.
10	CKSEL	I	Master clock selection. Select with oscillation frequency of VCXO. (L : 256f s, H : 384 fs)
11	128FS1	I	First system 128 fs clock input. Input 128 fs which generating at first PLL. If its not used, fix to L or H.
12	384/256FS1	I	First system 384/256 fs clock input. Input 256 fs or 384 fs which generating at first PLL. If its not used, fix to L or H.
13	FICNT	O	90-phase aberration detection. When the aberration of the 1st system LR clock and 2nd system LR clock is greater than 90-, a L level signal is output.
14	Vss1	–	Ground 1 for internal logic or I/O.
15	V_{DD2}	–	Power supply voltage 2 for phase comparating output.
16	PD2	O	Phase comparating output of phase detection 2. (Connect to enable of external 3 state.)
17	PD1	O	Phase comparating output of phase detection 1. (Connect to enable of external 3 state.)
18	PD	O	Phase comparating output of phase detection. (Internal 3 state output.)
19	Vss2	–	Ground 2 for phase comparating output.
20	VCOI	I	Master clock input. Input master clock from external VCXO.
21	384/256FS2	O	384/256 fs clock output. When pin 24 is H, first system 384/256 fs clock will out. When pin 24 is L, second system 384/256 clock will out.
22	MUTED	I	Forced mute input. Forced mute of second system data. (H : Mute ON, L : Mute OFF)
23	128FS2	O	128f s clock output. When pin 24 is H, first system 128 fs bit clock will out. When pin 24 is L, second system 128 fs clock will out.
24	CKCONT	I	First / Second system select. Switch the first or second systems clock output. (L : Second system, H : First system) Data output is in the same manner.
25	BCK2	O	Bit clock output. When pin 24 is H, first system bit clock will out. When pin 24 is L, second system bit clock will out.
26	MUTEA	O	External system mute output. Mute control signal output to external system. (H : Mute ON, L : Mute OFF)
27	WDCK2	O	Word clock output. When pin 24 is H, first system word clock will out. When pin 24 is L, second system word clock will out.
28	LRCK2	O	LR clock output. When pin 24 is H, first system LR clock will out. When pin 24 is L, second system LR clock will out.

9. ADJUSTMENTS

1. Adjustment Methods

If a compact disc recorder is adjusted incorrectly or inadequately, it may malfunction or not work at all even though there is nothing at all wrong with the pickup or the circuitry. Adjust correctly following the adjustment procedure.

● Measuring Instruments and Tools

1. Dual trace oscilloscope (10 : 1 probe)
2. Low-frequency oscillator
3. Test disc (YEDS-7)
4. Low pass filter (39kΩ +0.001 μF), (560kΩ +0.047 μF)
5. Resistor (100 kΩ)
6. Hexagonal screwdriver (1.5mm diagonal)
7. Standard tools
8. Optical power meter
9. Small screwdriver

● Adjustment Items/Verification Items and Order

Adjustment 1

Step	Item	Test Point	Adjustment Location
1	Playback power adjustment	Objective lens of pickup	VR103 (PB. PW)
2	Coarse focus offset adjustment	TP201, Pin 6 (FCS ERR)	VR105 (FE. OFS)
3	Coarse skew adjustment	TP201, Pin 1 (RF)	Radial tilt adjustment screw and Tangential tilt adjustment screw
4	Grating adjustment	TP2, Pin 5 (TF)	Grating adjustment slit
5	DPP (tracking offset) adjustment	TP2, Pin 5 (TF)	VR112 (TE. OFS)
6	Fine skew adjustment	TP201, Pin 1 (RF)	Radial tilt adjustment screw and Tangential tilt adjustment screw
7	Grating re-adjustment	TP2, Pin 5 (TE)	Grating adjustment slit

Adjustment 2

Step	Item	Test Point	Adjustment Location
1	Slider speed control offset adjustment	TP1, Pin 7 (SLDDRV)	VR101 (SLD. OFS)
2	Sample pulse phase adjustment	TP1, Pin 3 (EFM) TP1, Pin 4 (XSAMPLE)	VR102 (SMPL. OLY)
3	Playback power re-adjustment	Objective lens of pickup	VR103 (PB. PW)
4	Recording power adjustment	Objective lens of pickup	VR104 (REC. PW)
5	Focus offset adjustment	TP201, Pin 6 (FCSER)	VR105 (FE. OFS)
6	RF offset adjustment	TP201, Pin 1 (RF)	VR106 (RF. OFS)
7	WBL + offset adjustment	TP2, Pin 8 (RWBL)	VR107 (WBL+. OFS)
8	WBL offset adjustment	TP2, Pin 7 (WBL)	VR108(WBL. OFS)
9	Main and Sub mix ratio a djustment	TP2, Pin 3 (STE) TP2, Pin 4 (MSTE)	VR110 (MS. MIXRATE)
10	Tracking amp. gain adjustment	TP2, Pin 5 (TE)	VR111 (TE. GAIN)
11	Tracking offset adjustment	TP2, Pin 5 (TE)	VR112 (TE. OFS)
12	Fine focus offset adjustment	TP201, Pin 1 (RF)	VR105 (FE. OFS)
13	Focus servo loop gain adjustment	TP201, Pin 5 (FCSIN) TP201, Pin 6 (FCSER)	VR201 (FCS. GAIN)
14	Tracking servo loop gain adjustment	TP201, Pin 2 (TRKER) TP201, Pin 3 (TRKIN)	VR202 (TRK. GAIN)

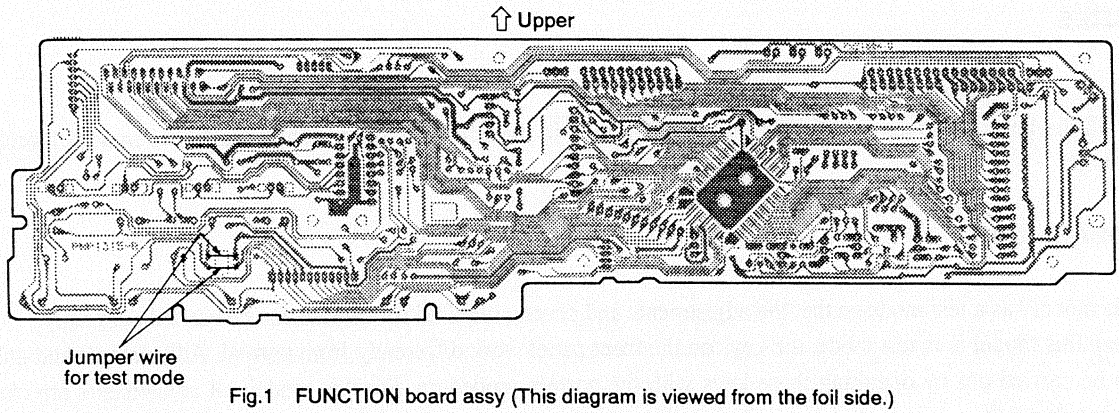

Fig.1 FUNCTION board assy (This diagram is viewed from the foil side.)

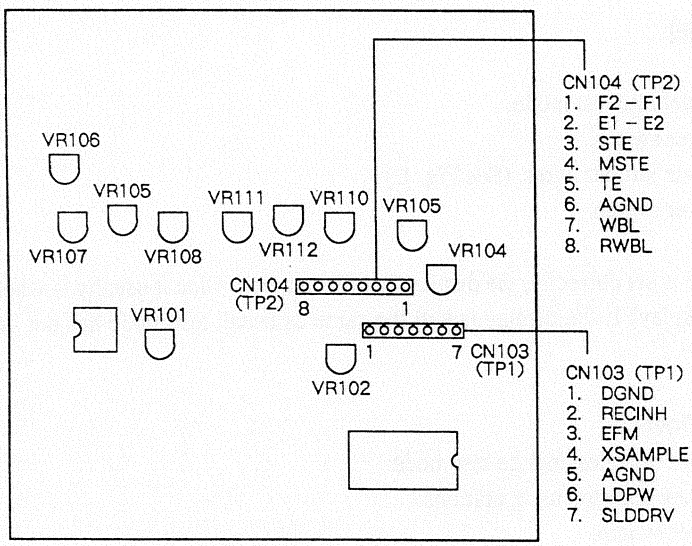

Fig.2 HEAD board assy

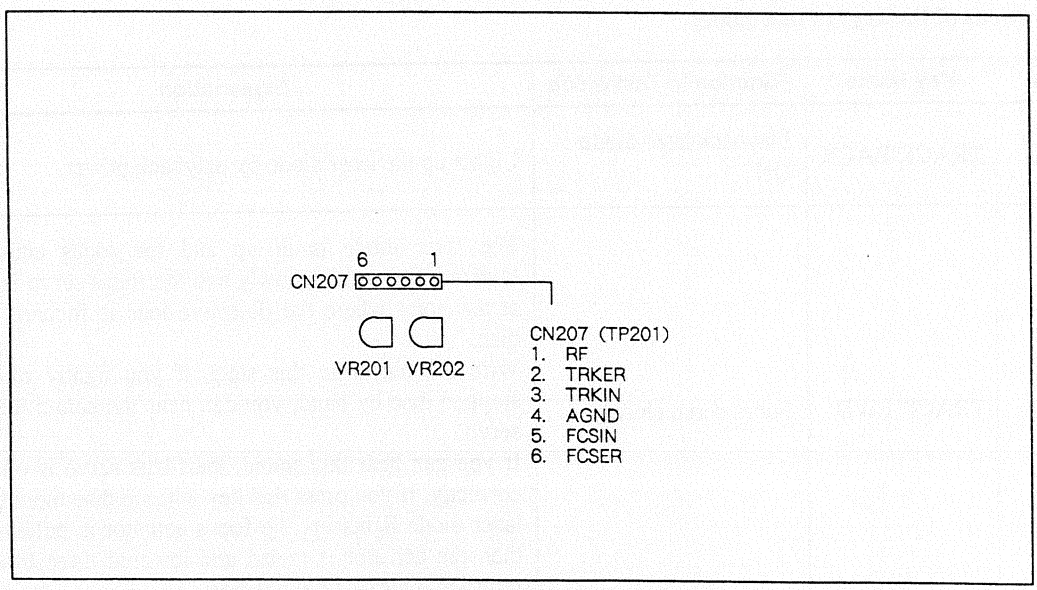

Fig.3 SERVO•DIGITAL board assy

● Notes

1. Use a 10:1 probe for the oscilloscope.
2. All the knob positions (settings) for the oscilloscope in the adjustment procedures are for when a 10:1 probe is used.

● Test Mode

This model has a test mode so that the adjustments and checks required for service can be carried out easily.
When this model is in test mode, the keys on the front panel work differently from normal. Adjustments and checks can be carried out by operating these keys with the correct procedure. For this model, all adjustments are carried out in test mode.

[Setting to Test Mode]

How to set this model into test mode.
1. Turn off the power switch.
2. Short the test mode jumper wires. (See Fig. 1.)
3. Turn on the power switch.

When the test mode is set correctly, the display is different from what it usually is when the power is turned on. (lights up all FL display) If the display is still the same as usual, test mode has not been set correctly, so repeat Steps 1 − 3.

[Release from Test Mode]

Here is the procedure for releasing the test mode:
1. Press the STOP key and stop all operations.
2. Turn off the power switch.

[Operations of the keys in test mode]

Code	Key Name	Function In Test Mode	Explanation
⏮	TRACK BACK	Playback laser diode ON	Lights up the laser diode by playback power.
⏭	TRACK FWD	Focus servo closes	The laser diode is lit up and the focus actuator is lowered, then raised slowly and the focus servo is closed at the point where the objective lens is focused on the disc. With the player in this state, if you lightly rotate the stopped disc by hand, you can hear the sound the focus servo. If you can hear this sound, the focus servo is operating correctly. If you press this key with no disc mounted, the laser diode lights up, the focus actuator is pulled down, then the actuator is raised and lowered three times and returned to its original position.

Code	Key Name	Function In Test Mode	Explanation
▷	PLAY	Spindle servo ON	Starts the spindle motor in the clockwise direction and when the disc rotation reaches the prescribed speed (about 500 rpm at the inner periphery), sets the spindle servo in a closed loop.
▯▯	PAUSE	Tracking servo close/open	Pressing this key when the focus servo and spindle servo are operating correctly in closed loops puts the tracking servo into a closed loop, displays the track number being played back and the elapsed time on the front panel, and outputs the playback signal. If the elapsed time is not displayed or not counted correctly or the audio is not played back correctly, it may be that the laser is shining on the section with no sound recorded at the outer edge of the disc, that something is out of adjustment, or that there is some other problem. This key is a toggle key and open/close the tracking servo alternately. This key has no effect if no disc is mounted.
◁◁	MANUAL SEARCH REV	Carriage reverse (inwards)	Moves the pickup position toward the inner diameter of the disc. When this key is pressed with the tracking servo in a closed loop, the tracking servo automatically goes into an open loop. Since the motor does not automatically stop at the mechanical end point in test mode, be careful with this operation.
▷▷	MANUAL SEARCH FWD	Carriage forward (outwards)	Moves the pickup position toward the outer diameter of the disc. When this key is pressed with the tracking servo in a closed loop, the tracking servo automatically goes into an open loop. Since the motor does not automatically stop at the mechanical end point in test mode, be careful with this operation.
□	STOP	Stop	Initializes and the disc rotation stops. The pickup and disc remain where they are when this key is pressed.
⏏	OPEN/CLOSE	Disc tray open/close	Open/close the disc tray. This key is a toggle key and open/close tray alternately. Pressing this key when the disc is turning stops the disc, then opens the tray. This key operation does not affect the position of the pickup.
○ ↓ ◎	REC ↓ REC MUTE	Maximum recording power. Laser diode ON.	Lights up the laser diode with maximum recording power and normal EFM by pressing REC and REC MUTE keys in order. * The laser diode may be damaged if adjustments are made before pressing these keys.

[How to play back a disc in test mode]

In test mode, since the servos operate independently, playing back a disc requires that you operate the keys in the correct order to close the servos.
Here is the key operation sequence for playing back a disc in test mode.

TRACK FWD ▷▷|	Lights up the laser diode and closes the focus servo.
⇩	
PLAY ▷	Starts the spindle motor and closes the spindle servo.
⇩	
PAUSE ▯▯	Closes the tracking servo.

Wait at least 2-3 seconds between each of these operations.

1. Playback Power Adjustment

Adjustment 1

● Objective	To optimize the playback power of the laser diode.		
● Symptom when out of adjustment	Play does not start, track search is impossible, track are skipped.		
● Measurement instrument connections	Shine the light dischrged from the objective lens on the light power meter sensor. [Settings] Wavelength 790mm Average mode	● Player state ● Adjustment location ● Disc	Test mode, Playback laser diode ON VR103 (PB. PW) None needed

[Procedure]

1. Move the pickup to the outer edge of the disc with the MANUAL SEARCH FWD ▷▷ key.
2. Lights up the playback laser diode by TRACK BACK |◁◁ key.
3. Shine the light discharged from the objective lens in the pickup on the light power meter sensor. Adjust VR103 (PB.PW) so that the playback laser diode output is an average 0.6 mW ± 0.05 mW.

* Recording on the disc is not possible in test mode.

2. Coarse Focus Offset Adjustment

Adjustment 1

● Objective	To coarse adjust the DC offset voltage of the focus servo circuit for perform the tracking and slider adjustments correctly.		
● Symptom when out of adjustment	The model does not focus in, sound broken and the RF signal is dirty.		
● Measurement instrument connections	Connect the oscilloscope to TP201, Pin 6 (FCSERR) (Servo • digital board assy) [Settings] 1 mV/division 10 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, stop VR105 (FE. OFS) YEDS-7

[Procedure]

1. Adjust VR105 (FE. OFS) so that the DC voltage at TP201, Pin 6 (FCSER) is 0 ± 10mV .

3. Coarse Skew Adjustment

Adjustment 1

● Objective	To coarse adjust the angle to the disc of pickup for perform the grating and DPP (tracking offset) adjustments correctly.		
● Symptom when out of adjustment	Sound broken, some discs can be played but not others.		
● Measurement instrument connections	Connect the oscilloscope to TP201, Pin 1 (RF). (Servo • digital board assy) [Settings] 20 mV/division 200 ns/division AC mode	● Player state ● Adjustment location ● Disc	Test mode, play Radial adjustment screw and tangential adjustment screw YEDS-7

[Procedure]

1. Move the pickup to the position where the radial/tangential adjustment screws will be seen with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys so that the radial/tangential adjustment screws can be adjusted.
   Press the TRACK FWD ▷▷| key, then the PLAY ▷ key in that order to close the spindle servo.
2. Adjust the RAD (radial direction) and TAN (tangential direction) adjustment acrews alternately with hexagonal screwdriver (1.5 mm) to maximize the RF output at TP201 pin 1.

Note : Radial and tangential mean the direction relative to the disc shown in Fig. 4.

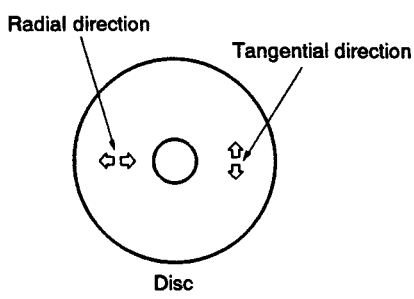

Fig. 4

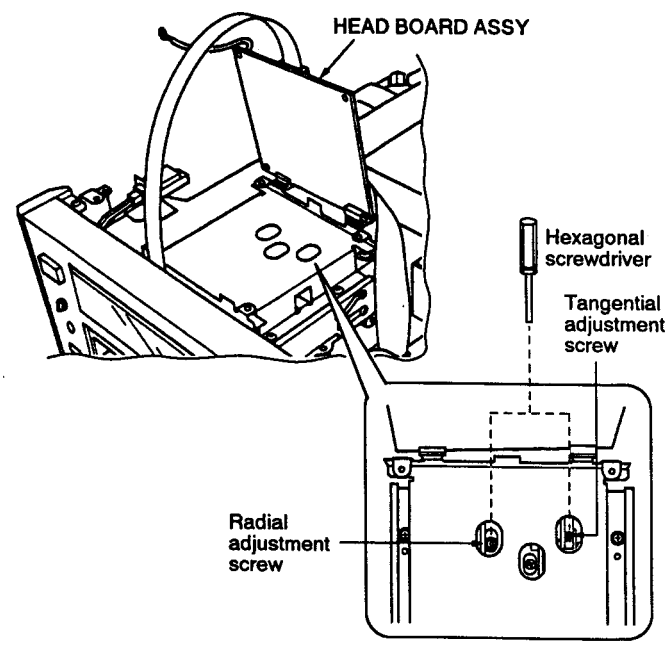

4. Grating Adjustment

Adjustment 1

● Objective	To align the tracking error generation laser beam spots to the optimum angle on the track.		
● Symptom when out of adjustment	Play does not start, track search is impossible, tracks are skipped.		
● Measurement instrument connections	Connect the oscilloscope to TP2, Pin 5 (TE) via a low pass filter. (see Fig. 5) [Settings] 50 mV/division 5 ms/division DC mode	● Player state	Test mode, focus and spindle servos closed and tracking servo open
		● Adjustment location	Grating slit on pickup
		● Disc	YEDS-7

[Procedure]

1. Move the pickup to the position where the grating adjustment slit will be seen with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys so that the grating adjustment can be adjusted.
2. Press the TRACK FWD ▷▷▯ key, then the PLAY ▷ key in that order to close the focus servo then the spindle servo.
3. Insert a screwdriver into the grating adjustment slit and adjust the grating to find the null point.
   For more details, see next page.
4. If you slowly turn the screwdriver clockwise from the null point, the amplitude of the wave gradually increases, then if you continue turning the screwdriver, the amplitude of the wave becomes smaller again. Turn the screw driver counterclockwise from the null point and set the grating to the first point where the wave amplitude reaches its maximum.
   Reference : Fig.6 shows the relation between the angle of the tracking beam with the track and the waveform.
5. Return the pickup to more or less midway across disc with the MANUAL SEARCH REV ◁◁ key, press the PAUSE ▯▯ key and check that the track number and elapsed time are displayed on the front panel. If they are not displayed at this time or the elapsed time changes irregularly, check the null point and adjust the grating again.

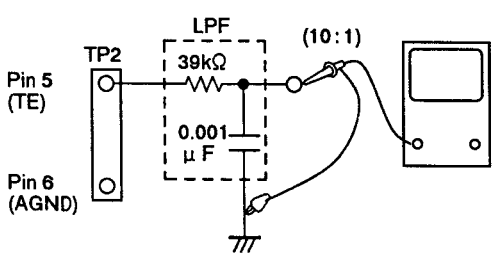

Fig. 5

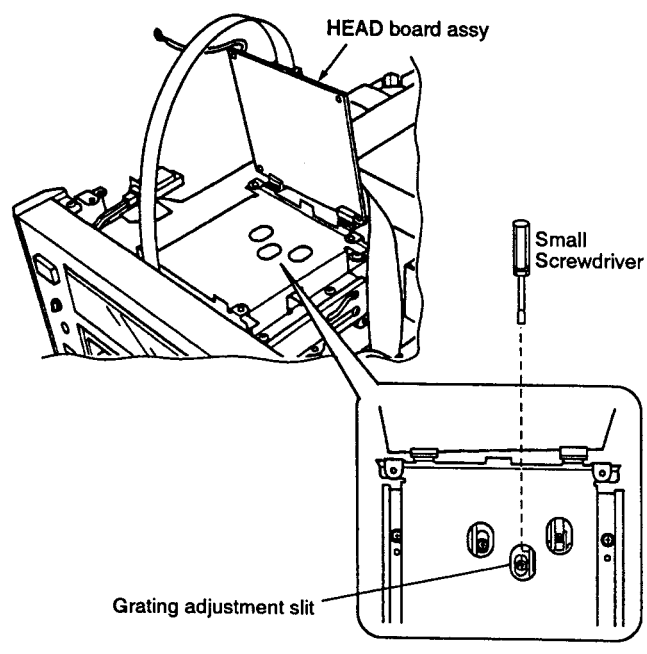

[How to find the null point]

When you insert the small screwdriver into the slit for the grating adjustment and change the grating angle, the amplitude of the tracking error signal at TP2, Pin 5 changes. Within the range for the grating, there are five or six locations where the amplitude of the wave reaches a minimum. Of these five or six locations, there is only one at which the envelope of the waveform is smooth. This location is where the three laser beams divided by the grating are all right above the same track. (See Fig. 6.)

This point is called the null point. When adjusting the grating, this null point is found and used as the reference position.

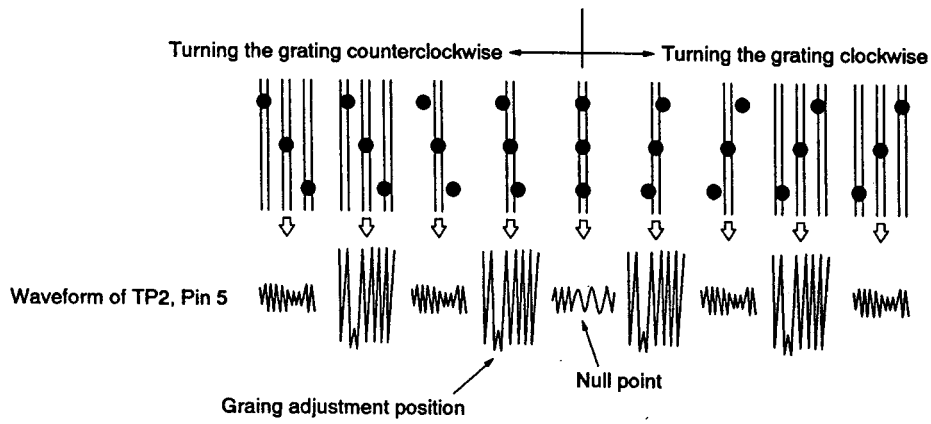

Fig. 6

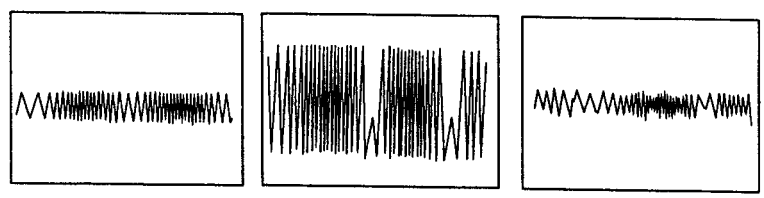


Note : If the difference between the amplitude of the error signal at the innermost edge and outermost edge of the disc is more than 10%, adjust the grating again.

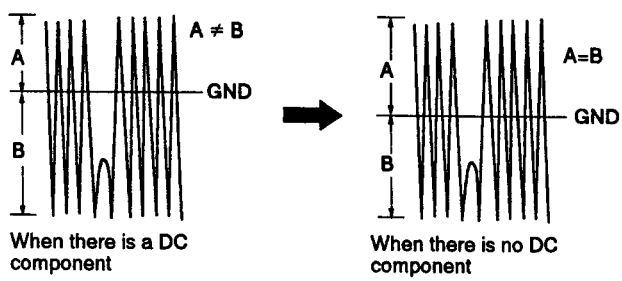
5. DPP (Tracking Offset) Adjustment

Adjustment 1

● Objective	To correct for the variation in the sensitivity of the tracking photodiode.		
● Symptom when out of adjustment	Play does not start or track search is impossible.		
● Measurement instrument connections	Connect the oscilloscope to TP2, Pin 5 (TE) [This connection may be via a low pass filter (39kΩ +0.001 μF).] [Settings] 50 mV/division 5 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, focus and spindle servos closed and tracking servo open VR112 (TE. OFS) YEDS-7

[Procedure]

1. Move the pickup to midway across the disc (R=35mm) with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys.
2. Press the TRACK FWD ▷▷| key, then the PLAY ▷ key in that order to close the focus servo then the spindle servo.
3. Line up the bright line (ground) at the center of the oscilloscope screen and put the oscilloscope into DC mode.
4. Adjust VR112 (TE. OFS) so that the positive amplitude and negative amplitude of the tracking error signal at TP2, Pin 5 (TE) are the same (in other words, so that there is no DC component).



When there is a DC component

When there is no DC component

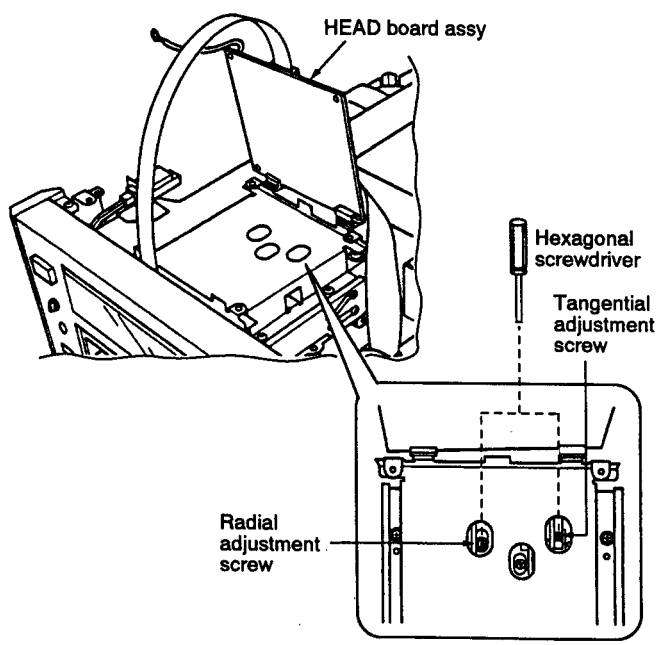
6. Fine Skew Adjustment

Adjustment 1

● Objective	To adjust the angle of the pickup relative to the disc so that the laser beams are shone straight down into the disc for the best read out of the RF signals.		
● Symptom when out of adjustment	Sound broken, some discs can be played but not others.		
● Measurement instrument connections	Connect the oscilloscope to TP201, Pin 1 (RF). (Servo • digital board assy) [Settings] 20mV/division 200ns/division AC mode	● Player state ● Adjustment location ● Disc	Test mode, focus and spindle servos closed and tracking servo open Pickup radial adjustment screw and tangential adjustment screw YEDS-7

[Procedure]

1. Move the pickup to the position where the radial/tangential adjustment screws will be seen with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys so that the radial/tangential adjustment screws can be adjusted.
   Press the TRACK FWD ▷▷| key, then the PLAY ▷ key in that order to close the focus servo then the spindle servo.
2. First, adjust the radial adjustment screw with the hexagonal screwdriver so that the eye pattern (the diamond shape at the center of the RF signal) can be seen the most clearly.
3. Next, adjust the tangential adjustment screw with the hexagonal screwdriver so that the eye pattern can be seen the most clearly (Fig. 7).
4. Adjust the radial adjustment screw and the tangential adjustment screw again so that the eye pattern can be seen the most clearly. As necessary, adjust the two screws alternately so that the eye pattern can be seen the most clearly.



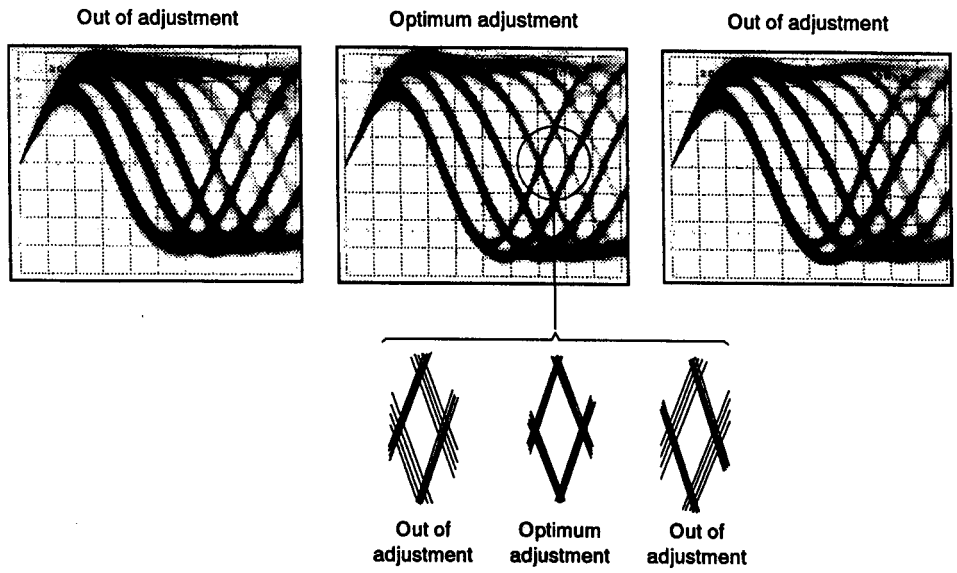


Fig.7 Eye pattern

7. Grating Re-Adjustment

Adjustment 1

Adjust in the same manner as "4. Grating Adjustment" in Adjustment 1.

1. Slider Speed Control Offset Adjustment

Adjustment 2

● Objective	To optimize the DC offset voltage of the slider speed control amp.		
● Symptom when out of adjustment	Player does not playback (slider moves at stop).		
● Measurement instrument connections	Connect the oscilloscope to TP1, Pin 7 (SLDDRV). GND : TP1, Pin 5 (AGND) [This connection may be via a low pass filter (560k Ω +0.047 μF)] [Settings] 1 mV/division 5 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, stop VR101 (SLD. OFS) None needed

[Procedure]

1. Move the pickup to midway across the disc with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys.
2. If the pickup (slider) continues moving even when you try to stop it, coarse adjust VR101 (SLD.OFS) to stop it.
3. Adjust VR101 (SLD.OFS) so that the DC voltage at TP1, pin 7 (SLDDRV) is 0 ± 10 mV.
4. Check that pickup (slider) movement is stopped.
   Perform adjustments from step 1 again if the pickup (slider) can move naturally.

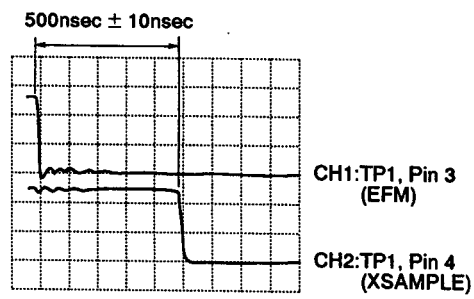
2. Sample Pulse Phase Adjustment

Adjustment 2

● Objective	To optimize the phase of the sampling pulses necessary for the servo during recording.		
● Symptom when out of adjustment	Player does not record nor playback self-recorded discs and skips tracks. (No problems during CD playback)		
● Measurement instrument connections	Connect the oscilloscope to CH1 : TP1, Pin 3 (EFM) CH2 : TP1, Pin 4 (XSAMPLE). GND : TP1, Pin 1 (DGND) [Settings] CH 1 : 0.2 V/division 100 ns/division DC mode CH 2 : 0.2 V/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, stop VR102 (SMPL. OLY) None needed

[Procedure]

1. Fully turn VR104 counterclockwise to reduce the power to the minimum.
2. Press the REC ○ key, then the REC MUTE ◎ key.
3. Adjust VR102 (SMPL.OLY) so that the time from the falling edge of TP1, pin 3 (EFM) to the faling edge of TP1, pin 4 (XSAMPLE) is 500 nsec ±10 nsec.



3. Playback power Re-Adjustment

Adjustment 2

Adjust in the same manner as "1. Playback Power Adjustment" in Adjustment 1.

4. Recording Power Adjustment

Adjustment 2

● Objective	To optimize the recording power of the laser diode.		
● Symptom when out of adjustment	The player does not record nor playback self-recorded discs. It also skips tracks and the RF waveform is dirty. (No problems during CD playback)		
● Measurement instrument connections	Shine the light discharged from the objective lens on the light power meter sensor. [Settings] Wavelength 790 nm Average mode	● Player state ● Adjustment location ● Disc	Test mode, maximum recording power ON VR104 (REC. PW) None needed

[Procedure]

1. Fully turn VR104 (REC.PW) counterclockwise to reduce the power to the minimum.
2. Move the pickup to the outer edge of the disc with the MANUAL SEARCH FWD ▷▷ key.
3. Press REC ○ and REC MUTE ⏀ keys in that order to lights up the laser diode.
4. Shine the light discharged from the objective lens in the pickup on the light power meter sensor and adjust VR104 (REC.PW) so that the playback laser diode output is an average of 5.3 mW ± 0.05 mW.

Notes

- Power more than ten times greater than playback power is released during these adjustments. Never look directly at the objective lens.
- The laser diode may be damaged if the recording power is greater than the specified value. Always perform step 1 before making adjustments and be careful not to exceed the specified value in step 4.

5. Focus Offset Adjustment

Adjustment 2

● Objective	To optimize the DC offset voltage of the focus error amp.		
● Symptom when out of adjustment	The player does not focus in and the RF signal is dirty.		
● Measurement instrument connections	Connect the oscilloscope to TP201, Pin 6 (FCSER). (Servo • digital board assy) [Settings] 1 mV/division 5 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, stop VR105 (FE. OFS) None needed

[Procedure]

1. Adjust VR105 (FE. OFS) so that the DC voltage at TP201, Pin 6 (FCSER) is 0 ± 10mV.

6. RF Offset Adjustment

Adjustment 2

● Objective	To optimize the DC offset voltage of the RF amp.		
● Symptom when out of adjustment	The player does not focus in and sound broken.		
● Measurement instrument connections	Connect the oscilloscope to TP201, Pin 1 (RF). (Servo•digital board assy) [Settings] 1 mV/division 5 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, stop VR106 (RF. OFS) None needed

[Procedure]

1. Adjust VR106 (RF. OFS) so that the DC voltage at TP201, Pin 1 (RF) is 0 ± 10mV.

7. WBL+ Offset Adjustment

Adjustment 2

● Objective	To adjust the gain balance of the wobble signal.		
● Symptom when out of adjustment	CD-R disc does not record and playback.		
● Measurement instrument connections	Connect the oscilloscope to TP2, Pin 8 (RWBL). [Settings] 1 mV/division 5 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, stop VR107 (WBL +. OFS) None needed

[Procedure]

1. Turn VR108 (WBL. OFS) to fully counterclockwise.
2. Adjust VR107 (WBL+. OFS) so that the DC voltage at TP2, Pin 8 (RWBL) is - 10mV ± 10mV.

8. WBL Offset Adjustment

Adjustment 2

● Objective	To optimize the DC offset voltage of the wobble amp.		
● Symptom when out of adjustment	CD-R disc does not record and playback.		
● Measurement instrument connections	Connect the oscilloscope to TP2, Pin 7 (WBL). [Settings] 1 mV/division 5 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, stop VR108 (WBL. OFS) None needed

[Procedure]

1. Adjust VR108 (WBL. OFS) so that the DC voltage at TP2, Pin 7 (WBL) is 0 ± 40mV.

9. Main and Sub Mix Ratio Adjustment

Adjustment 2

● Objective	To mix the gain of the main signal output and sub signal output of the pickup.		
● Symptom when out of adjustment	Player does not playback.		
● Measurement instrument connections	Connect the oscilloscope to CH1 : TP2, Pin 3 (STE) CH2 : TP2, Pin 4 (MSTE). [Settings] CH 1 : 50 mV/div. AC mode 10 ms/div. ADD mode CH 2 : 100 mV/div. AC mode	● Player state ● Adjustment location ● Disc	Test mode VR110 (MS. MIXRATE) YEDS-7

[Procedure]

1. Press the TRACK FWD ▷▷| key, then the PLAY ▷ key in that order to close the focus servo then the spindle servo.
2. Set the oscilloscope to ADD mode (waveform adding mode of CH1 and CH2) and observe the adding waveform of CH1 and CH2.
3. Adjust VR110 (MS. MIXRATE) so that the amplitude of waveform becomes minimum.

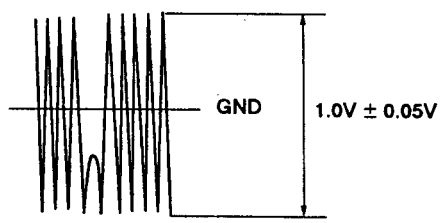
10. Tracking Amp. Gain Adjustment

Adjustment 2

● Objective	To correct the discrepancy in the tracking error level with the pickup.		
● Symptom when out of adjustment	Player does not playback, track search is impossible, tracks are skipped.		
● Measurement instrument connections	Connect the oscilloscope to TP2, Pin 5 (TE). [This connection may be via a low pass filter (39kΩ +0.001 μF).] [Settings] 20 mV/division 5 ms/division DC mode	● Player state ● Adjustment location ● Disc	Test mode, focus and spindle servos closed and tracking servo open VR111 (TE. GAIN) YEDS-7

[Procedure]

1. Move the pickup to midway across the disc (R=35mm) with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys.
2. Press the TRACK FWD ▷▷| key, then the PLAY ▷ key in that order to close the focus servo then the spindle servo.
3. Line up the bright line (ground) at the center of the oscilloscope screen and put the oscilloscope into DC mode.
4. Adjust VR111 (TE. GAIN) so that the positive amplitude and negative amplitude of the tracking error signal at TP2, Pin 5 (TE) is 1.0V ± 0.05V.



11. Tracking Offset Adjustment

Adjustment 2

Adjust in the same manner as "5. DPP Adjustment" in Adjustment 1.

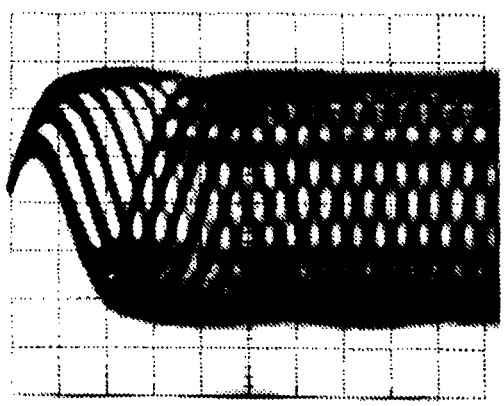
12. Fine Focus Offset Adjustment

Adjustment 2

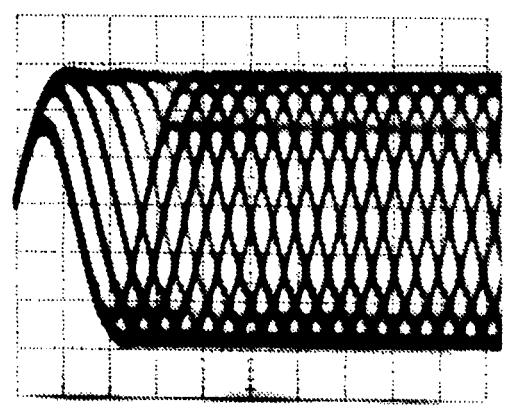
● Objective	To optimize the DC offset voltage of the focus servo circuit.		
● Symptom when out of adjustment	The player does not focus in, sound broken and the RF signal is dirty.		
● Measurement instrument connections	Connect the oscilloscope to TP201, Pin 1 (RF). (Servo•digital board assy) [Settings] 20 mV/division 500 ns/division AC mode	● Player state ● Adjustment location ● Disc	Test mode, play VR105 (FE. OFS) YEDS-7

[Procedure]

1. Move the pickup to midway across the disc (R=35mm) with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys. Press the TRACK FWD ▷▷▯ key, the PLAY ▷ key, then the PAUSE ▯▯ key in that order to close the respective servos and put the player into play mode.
2. Adjust VR105 (FE. OFS) so that the 3T waveform at TP201, Pin 1 (RF) is maximum.



Out of adjustment



Optimum adjustment

13. Focus Servo Loop Gain Adjustment

Adjustment 2

● Objective	To optimize the focus servo loop gain.		
● Symptom when out of adjustment	Playback does not start or focus actuator noisy.		
● Measurement instrument connections	See Fig. 8 (Servo • digital board assy) [Settings] CH 1 : 0.1 V/division X-Y mode CH 2 :10 mV/division	● Player state ● Adjustment location ● Disc	Test mode, play VR201 (FCS. GAIN) (Servo • digital board assy) YEDS-7

[Procedure]

1. Set the AF generator output to 1.2kHz and 1Vp-p.
2. Move the pickup to midway across the disc (R=35mm) with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys. Press the TRACK FWD ▷▷▯ key, the PLAY ▷ key, then the PAUSE ▯▯ key in that order to close the respective servos and put the player into play mode.
3. Adjust VR201 (FCS. GAIN) so that the lissajous waveform is symmetrical about the X axis and the Y axis.

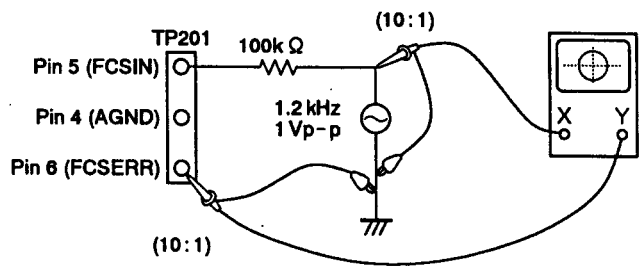


Fig. 8

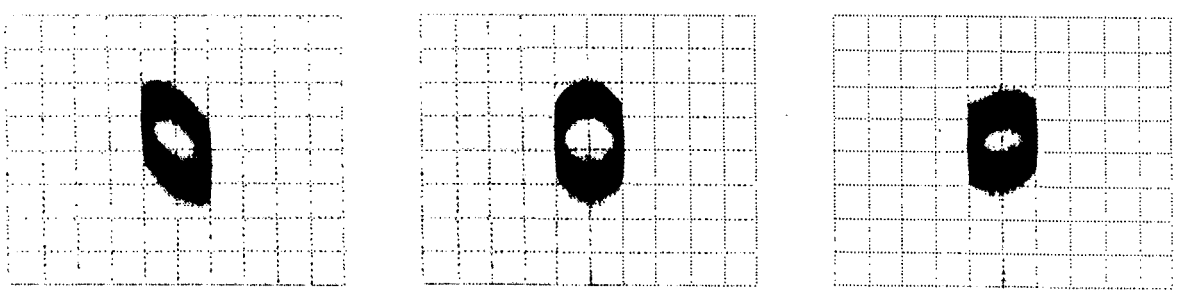

Higher gain　　Optimum gain　　Lower gain

14. Tracking Servo Loop Gain Adjustment

Adjustment 2

● Objective	To optimize the tracking servo loop gain.		
● Symptom when out of adjustment	Playback does not start, during searches the actuator is noisy, or tracks are skipped.		
● Measurement instrument connections	See Fig. 9. (Servo • digital board assy) [Settings] CH 1 : 0.1 V/division X - Y mode CH 2 :10 mV/division	● Player state ● Adjustment location ● Disc	Test mode, play VR202 (TRK. GAIN) (Servo • digital board assy) YEDS - 7

[Procedure]

1. Set the AF generator output to 1.2kHz and 2Vp - p.
2. Move the pickup to midway across the disc (R=35mm) with the MANUAL SEARCH FWD ▷▷ or REV ◁◁ keys. Press the TRACK FWD ▷▷▯ key, the PLAY ▷ key, then the PAUSE ▯▯ key in that order to close the respective servos and put the player into play mode.
3. Adjust VR202 (TRK. GAIN) so that the lissajous waveform is symmetrical about the X axis and the Y axis.

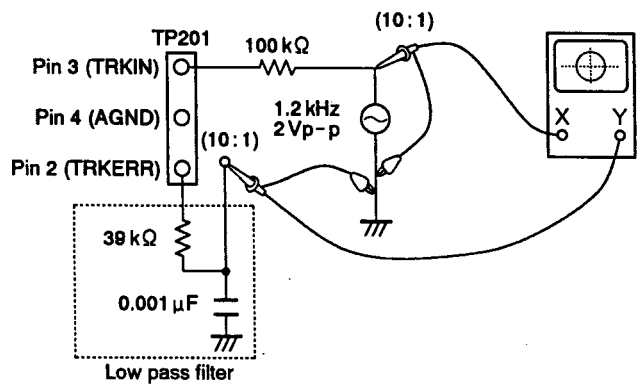

Fig. 9

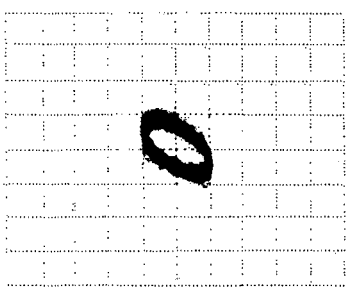
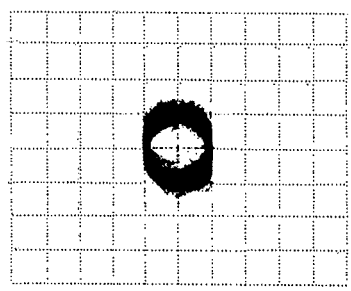
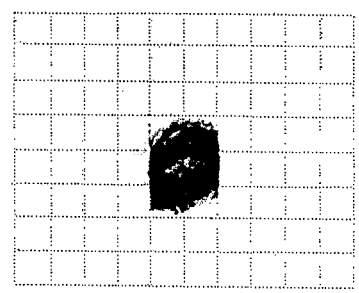


Higher gain



Optimum gain



Lower gain

10. PARTS LIST FOR EXPLODED VIEWS AND PACKING

NOTES:

- *Parts marked by "NSP" are generally unavailable because they are not in our Master Spare Parts List.*
- *The ⚠ mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.*
- *Parts marked by "◉" are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.*

	16	Protector R	PHA1247
	17	Packing case	PHG2089
	18	Mirror mat	VHL1012
	19	Top plate	PHC1047
	20	CD-R disc caution card	PRM1031
	21	Polyethylene bag	Z21-013

11. PCB PARTS LIST

NOTES:

- *Parts marked by "NSP" are generally unavailable because they are not in our Master Spare Parts List.*
- *The ⚠ mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.*
- *Parts marked by "◉" are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.*
- *When ordering resistors, first convert resistance values into code form as shown in the following examples.*

Ex.1 When there are 2 effective digits(any digit apart from 0), such as 560 ohm and 47k ohm(tolerance is shown by J=5%, and K=10%).

560Ω → 56 × 10¹ → 561 ..... RD1/8PM 5 6 1 J
47kΩ → 47 × 10³ → 473 ..... RD1/4PS 4 7 3 J
0.5Ω → 0R5 ..... RN2H 0 R 5 K
1Ω → 010 ..... RS1P 0 1 0 K

Ex.2 When there are 3 effective digits(such as in high precision metal film resistors).

5.62kΩ → 562 × 10¹ → 5621 ..... RN1/4PC 5 6 2 1 F

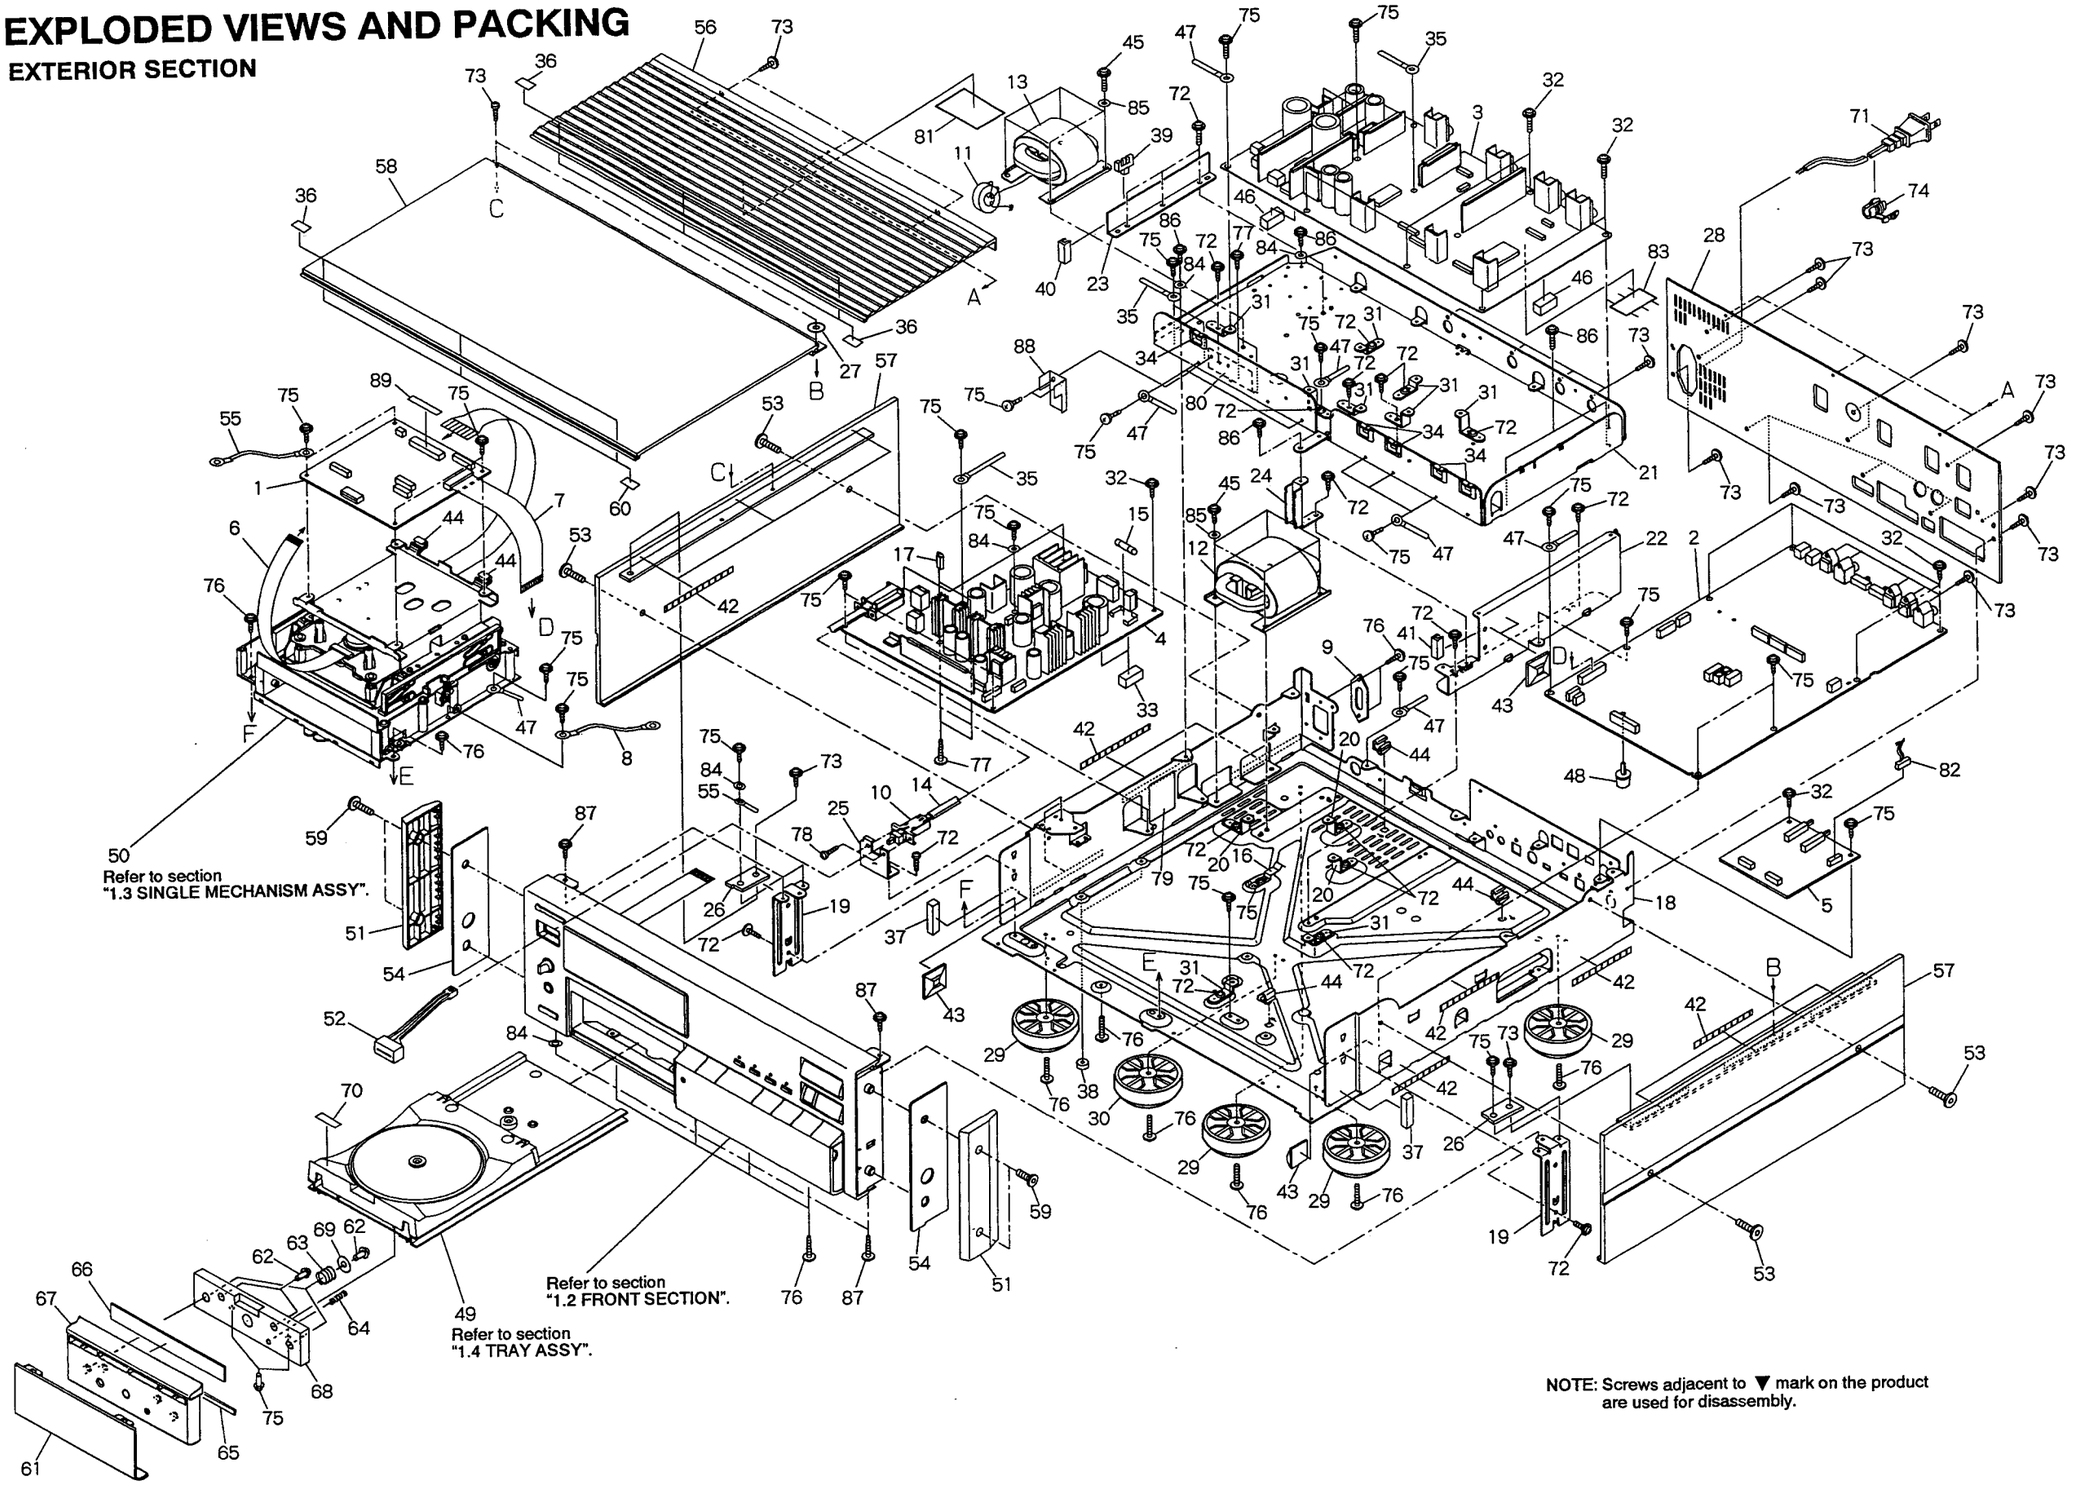
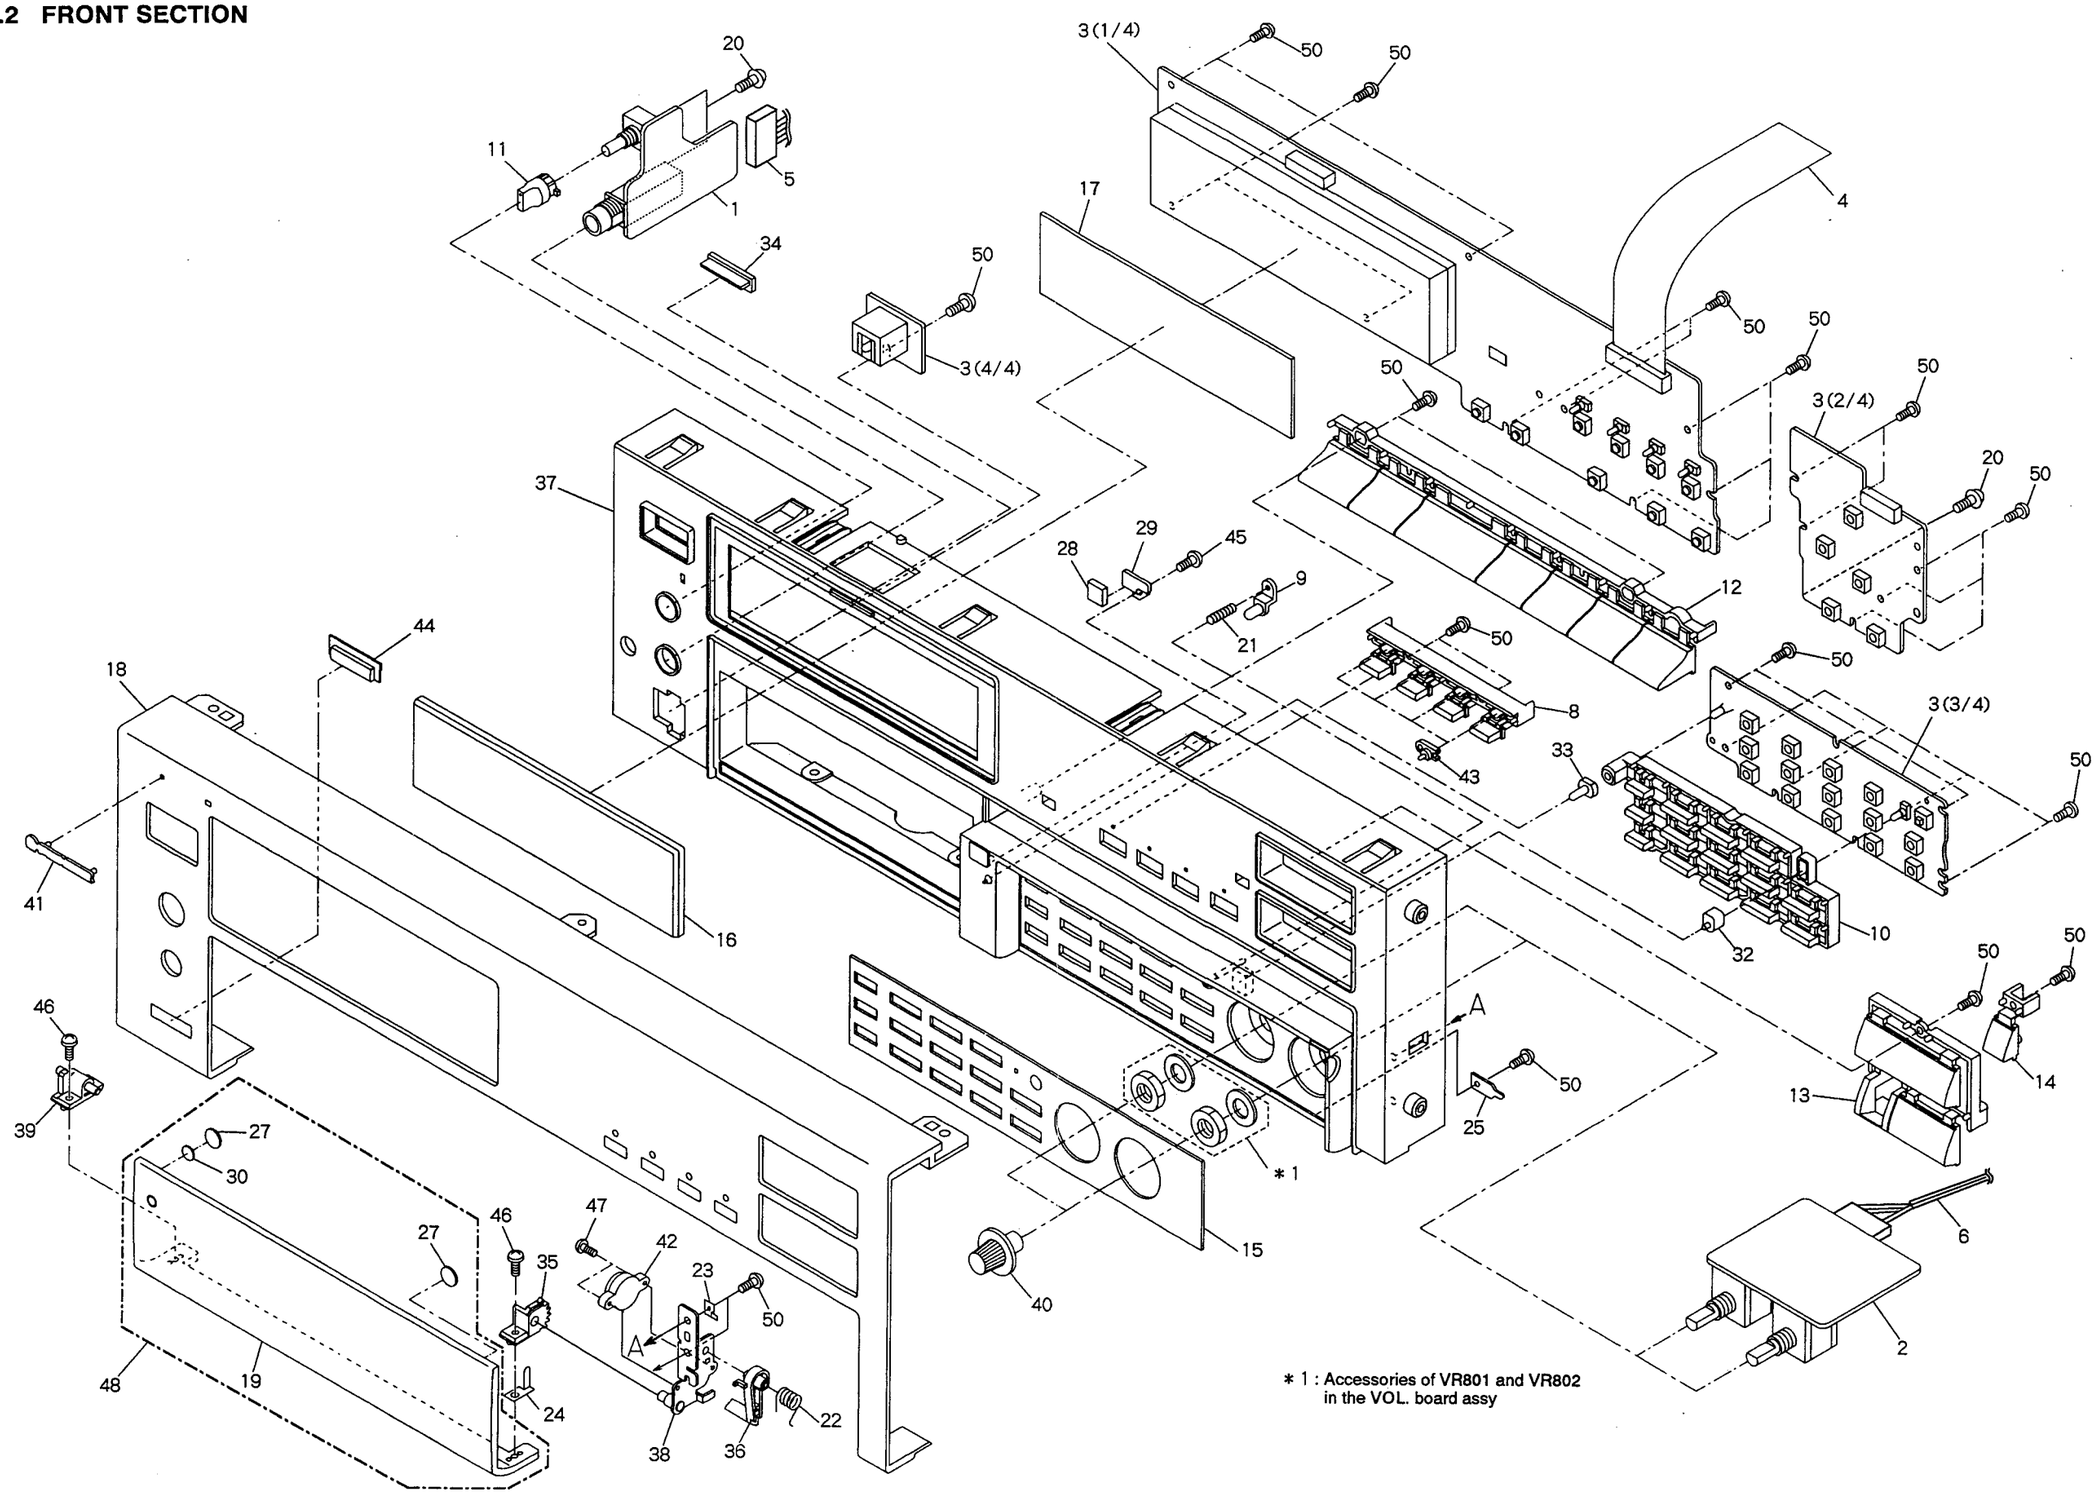
1. EXPLODED VIEWS AND PACKING

1.1 EXTERIOR SECTION



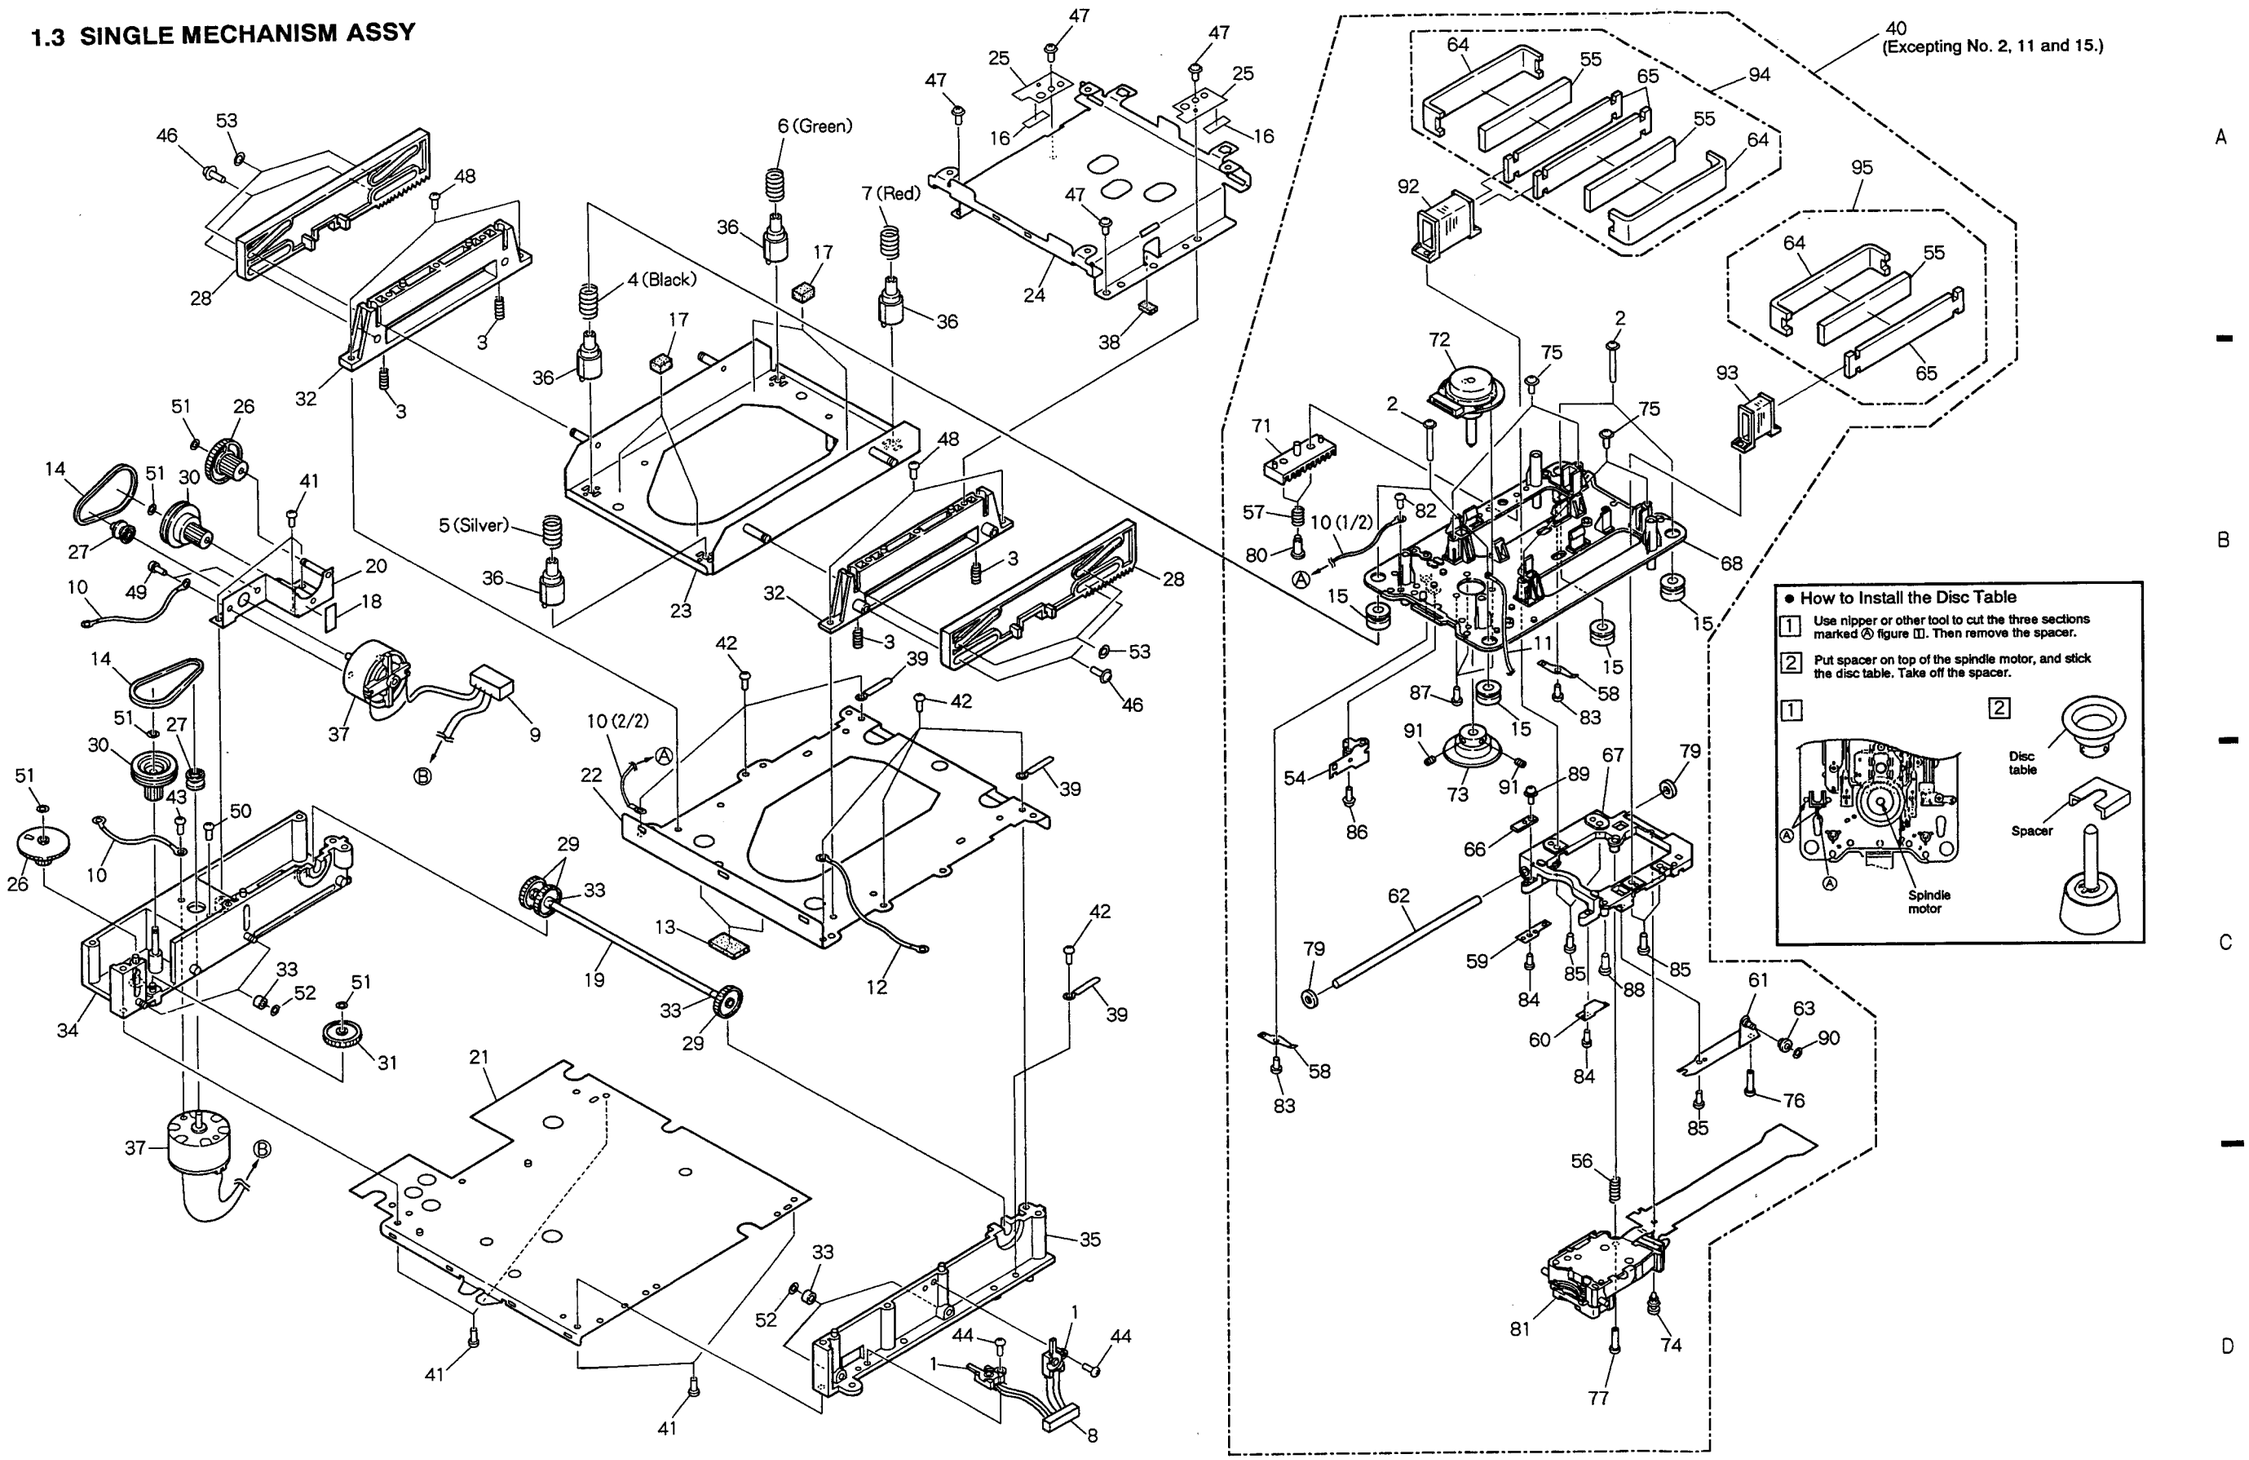
NOTE: Screws adjacent to ▼ mark on the product are used for disassembly.

1.2 FRONT SECTION

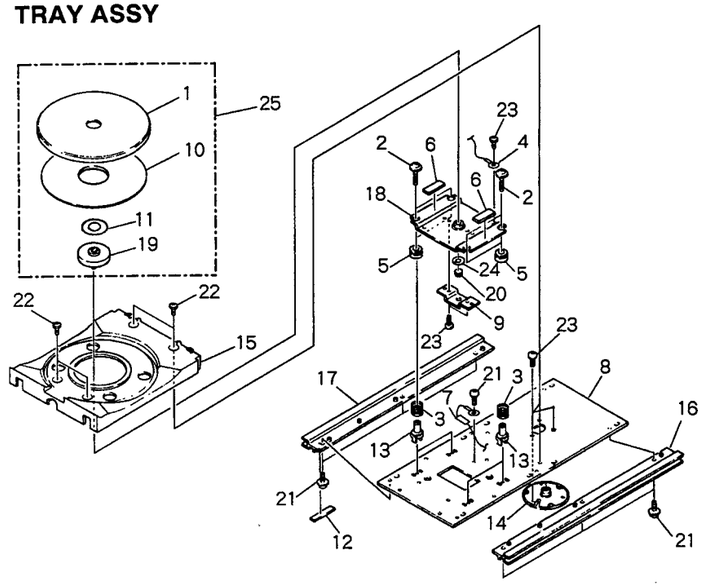


*1 : Accessories of VR801 and VR802 in the VOL. board assy

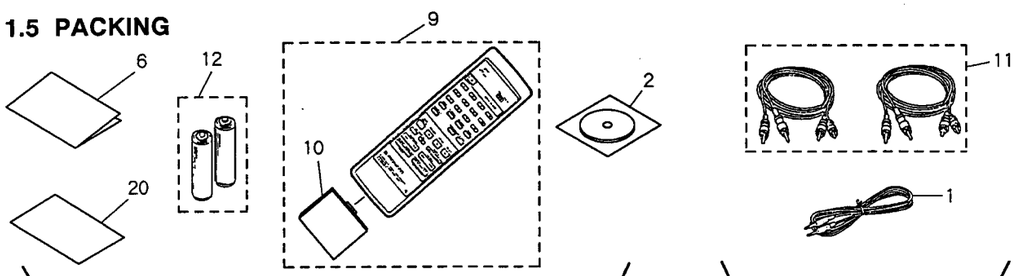
1.3 SINGLE MECHANISM ASSY

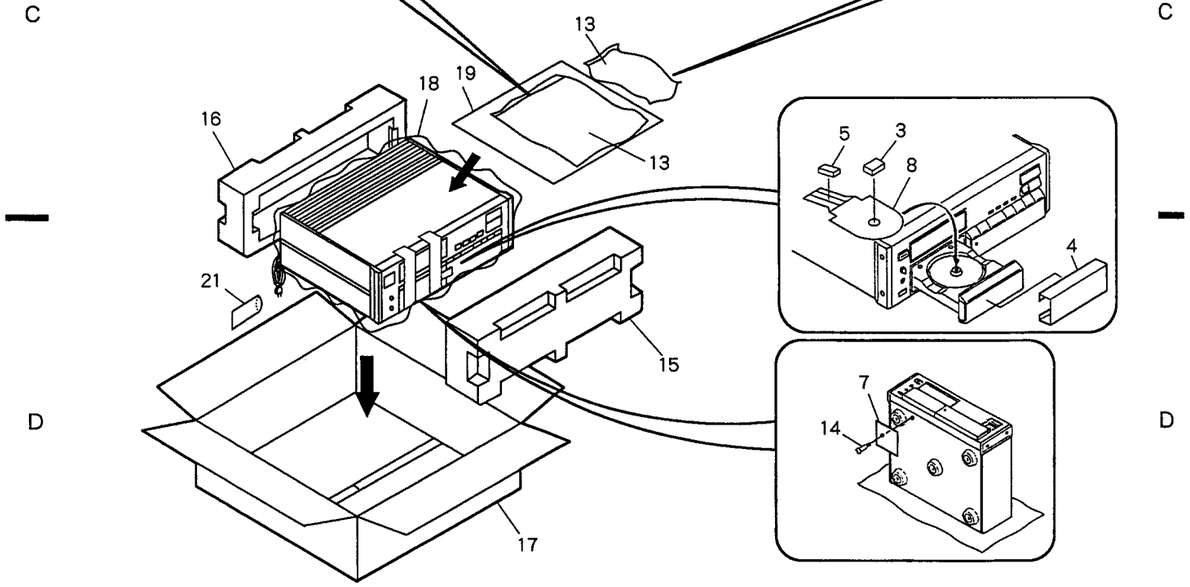


1.4 TRAY ASSY



1.5 PACKING





2. SCHEMATIC AND PCB CONNECTION DIAGRAMS

NOTE FOR SCHEMATIC DIAGRAMS (Type 4A)

1. **When ordering service parts, be sure to refer to "PARTS LIST of EXPLODED VIEWS" or "PCB PARTS LIST".**
2. **Since these are basic circuits, some parts of them or the values of some components may be changed for improvement.**
3. **RESISTORS:**
   Unit: k:kΩ, M:MΩ, or Ω unless otherwise noted.
   Rated power: 1/4W, 1/6W, 1/8W, 1/10W unless otherwise noted.
   Tolerance:(F):±1%, (G):±2%, (K):±10%, (M):±20% or ±5% unless otherwise noted.
4. **CAPACITORS:**
   Unit : p:pF or μF unless otherwise noted.
   Ratings : capacitor (μF) / voltage (V) unless otherwise noted.
   Rated voltage : 50V except for electrolytic capacitors.
5. **COILS:**
   Unit : m:mH or μH unless otherwise noted.
6. **VOLTAGE AND CURRENT:**
   ▭ or ←V :
   DC voltage (V) in PLAY mode unless otherwise noted.
   ⇦mA or ←mA :
   DC current in PLAY mode unless otherwise noted.
   Value in ( ) is DC current in STOP mode.
7. **OTHERS:**
   - ⊘ or ⊘ : Adjusting point.
   - ◀ : Measurement point.
   - The ⚠ mark found on some component parts indicates the importance of the safety factor of the parts. Therefore, when replacing, be sure to use parts of identical designation.
8. **SCH – □ ON THE SCHEMATIC DIAGRAM:**
   - SCH– □ indicates the drawing number of the schematic diagram. (SCH stands for schematic diagram.)
9. **SWITCHES** (Underline indicates switch position):

1. SAFETY INFORMATION

(FOR EUROPEAN MODEL ONLY)

VARO!
AVATTAESSA JA SUOJALUKITUS OHITETTAESSA OLET ALTTIINA NÄKYMÄTTÖMÄLLE LASERSÄTEILYLLE. ÄLÄ KATSO SÄTEESEEN.

ADVERSEL:
USYNLIG LASERSTRÅLING VED ÅBNING NÅR SIKKERHEDSAFBRYDERE ER UDE AF FUNKTION UNDGÅ UDSAETTELSE FOR STRÅLING.

VARNING!
OSYNLIG LASERSTRÅLNING NÄR DENNA DEL ÄR ÖPPNAD OCH SPÄRREN ÄR URKOPPLAD. BETRAKTA EJ STRÅLEN.

LASER
Kuva 1
Lasersateilyn
varoitusmerkki

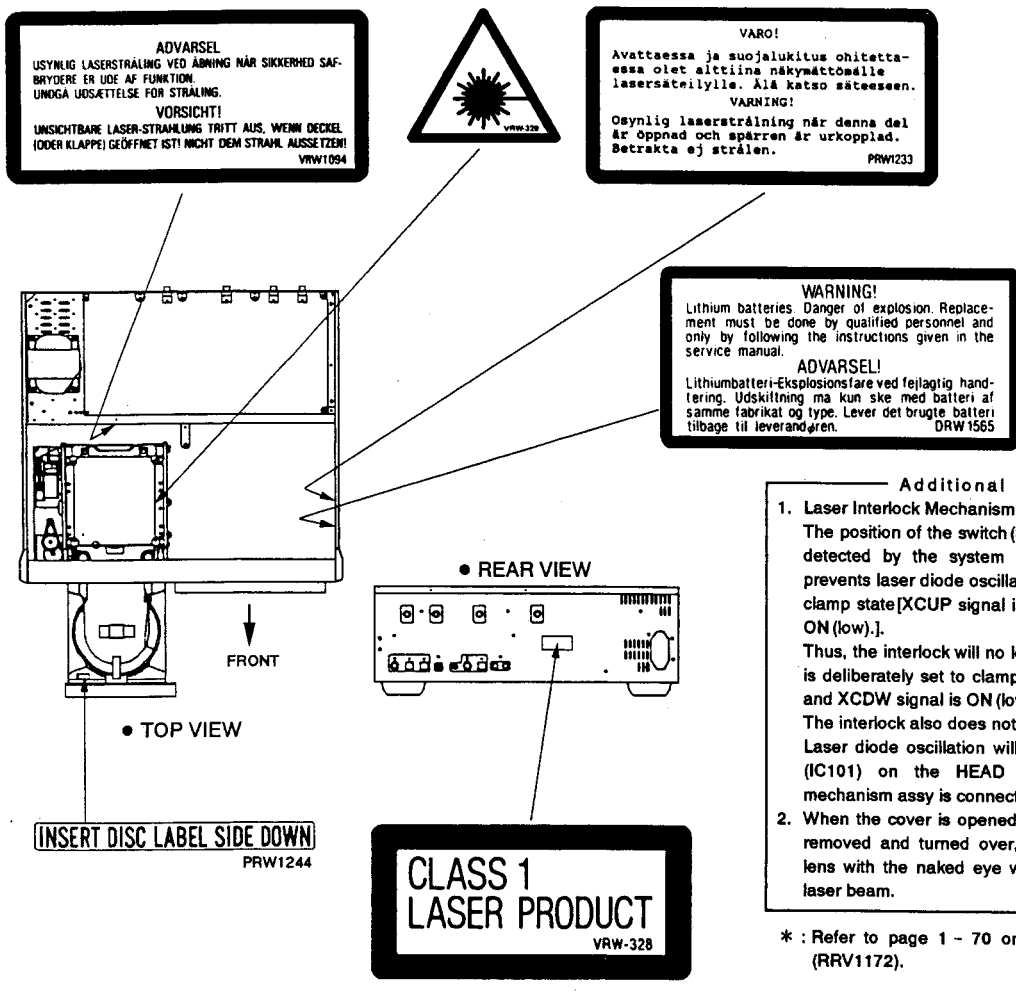
WARNING!
DEVICE INCLUDES LASER DIODE WHICH EMITS INVISIBLE INFRARED RADIATION WHICH IS DANGEROUS TO EYES. THERE IS A WARNING SIGN ACCORDING TO PICTURE 1 INSIDE THE DEVICE CLOSE TO THE LASER DIODE.

IMPORTANT
THIS PIONEER APPARATUS CONTAINS LASER OF CLASS 1.
SERVICING OPERATION OF THE APPARATUS SHOULD BE DONE BY A SPECIALLY INSTRUCTED PERSON.

LASER DIODE CHARACTERISTICS
MAXIMUM OUTPUT POWER: 30mw
WAVELENGTH: 780-785 nm

LASER
Picture 1
Warning sign for
laser radiation

LABEL CHECK



Additional Laser Caution

1. Laser Interlock Mechanism
   The position of the switch (S102) for detecting clamp state is detected by the system microprocessor, and the design prevents laser diode oscillation when the switch (S102) is not clamp state [XCUP signal is OFF (high) and XCDW signal is ON (low).].
   Thus, the interlock will no longer function if the switch (S102) is deliberately set to clamp state [XCUP signal is OFF (high) and XCDW signal is ON (low).].
   The interlock also does not function in the test mode ＊.
   Laser diode oscillation will continue, if pin 39 of PA4020A (IC101) on the HEAD assy mounted on the single mechanism assy is connected to GND.
2. When the cover is opened with the servo mechanism block removed and turned over, close viewing of the objective lens with the naked eye will cause exposure to a Class 1 laser beam.

92TT1B

＊ : Refer to page 1 - 70 on the service manual PDR - 09 (RRV1172).

LITHIUM BATTERY NOTICE

WARNING!

Lithium batteries. Danger of explosion. Replacement must be done by qualified personnel and only by following the instructions given in the service manual.

This warning is stated on the product or in the operating instructions. When replacing the lithium batteries, follow the note below.
Dispose of the used battery promptly. Keep away from children. Do not disassemble and do not dispose of in fire.
The battery used in this device may present a fire or chemical hazard if mistreated. Do not recharge, disassemble, heat above 100°C or incinerate. Replace only with the same Part Number. Use of another battery may present a risk of fire or explosion.

Note: The lithium battery installation position is shown in the exploded view and the P.C. board pattern.

ADVARSEL!

Lithiumbatteri — Eksplosionsfare ved fejlagtig håndtering. Udskiftning må kun ske med batteri af samme fabrikat og type. Levér det brugte batteri tilbage til leverandøren.

Denne advarsel or angivet på produktet eller i brugsvejledningen. Ved udskiftning af lithium batterierne følges nedenstående anveisning.
Batterierne må kun udskiftes med batterier af samme type og mærke.

VARNING!

Explosionsfara vid felaktigt batteribyte. Använd samma batterityp eller en ekvivalent typ som rekommenderas av apparattillverkaren. Kassera använt batteri enligt fabrikantens instruktion.

Denna varning finns på apparaten eller i bruksanvisningen. Följ nedanstående anvisningar vid byte av litiumbatterier.
Batterierna får endast bytas ut mot litiumbatterier av samma typ och fabrikat.

2. CONTRAST OF MISCELLANEOUS PARTS

NOTES:
- *Parts marked by "NSP" are generally unavailable because they are not in our Master Spare Parts List.*
- *The ⚠ mark found on some component parts indicates the importance of the safety factor of the part. Therefore, when replacing, be sure to use parts of identical designation.*
- *Parts marked by "◉" are not always kept in stock. Their delivery time may be longer than usual or they may be unavailable.*

NOTE FOR SCHEMATIC DIAGRAMS (Type 4A)

1. When ordering service parts, be sure to refer to "PARTS LIST of EXPLODED VIEWS" or "PCB PARTS LIST".
2. Since these are basic circuits, some parts of them or the values of some components may be changed for improvement.
3. **RESISTORS:**
   Unit: k:kΩ, M:MΩ, or Ω unless otherwise noted.
   Rated power: 1/4W, 1/6W, 1/8W, 1/10W unless otherwise noted.
   Tolerance:(F): ±1%, (G): ±2%, (K): ±10%, (M): ±20% or ±5% unless otherwise noted.
4. **CAPACITORS:**
   Unit : p:pF or μF unless otherwise noted.
   Ratings : capacitor (μF) / voltage (V) unless otherwise noted.
   Rated voltage : 50V except for electrolytic capacitors.
5. **COILS:**
   Unit : m:mH or μH unless otherwise noted.
6. **VOLTAGE AND CURRENT:**
   ▭ or ←V :
   DC voltage (V) in PLAY mode unless otherwise noted.
   ⇦mA or ←mA :
   DC current in PLAY mode unless otherwise noted.
   Value in ( ) is DC current in STOP mode.
7. **OTHERS:**
   - ⊘ or ⊘ : Adjusting point.
   - ◀ : Measurement point.
   - The ⚠ mark found on some component parts indicates the importance of the safety factor of the parts. Therefore, when replacing, be sure to use parts of identical designation.
8. **SCH - □ ON THE SCHEMATIC DIAGRAM:**
   - SCH-□ indicates the drawing number of the schematic diagram. (SCH stands for schematic diagram.)
